# MMO 101:

Approaches that have been taken at Disney Online Studios in the development of our MMO environments.

# Roger H. Hughston

- ⌚ **Almost 25 years as a computer professional.**
- ⌚ **Over 20 years with Disney.**
  - ⌚ **Information Technology / Imagineering / VR studio / Disney Online.**
- ⌚ **Disney Online Studios - Director of Architecture, Research & Development.**
- ⌚ **A bunch of MMO and MMO type projects.**
- ⌚ **Love to play games and love to build them.**

# OK, what is a Disney MMO?

⊕ A computer experience in which a large number of children and their families can simultaneously interact in a persistent world.

- ⊕ Children and their families
- ⊕ Large number of
- ⊕ Simultaneous
- ⊕ Interactive
- ⊕ Persistent

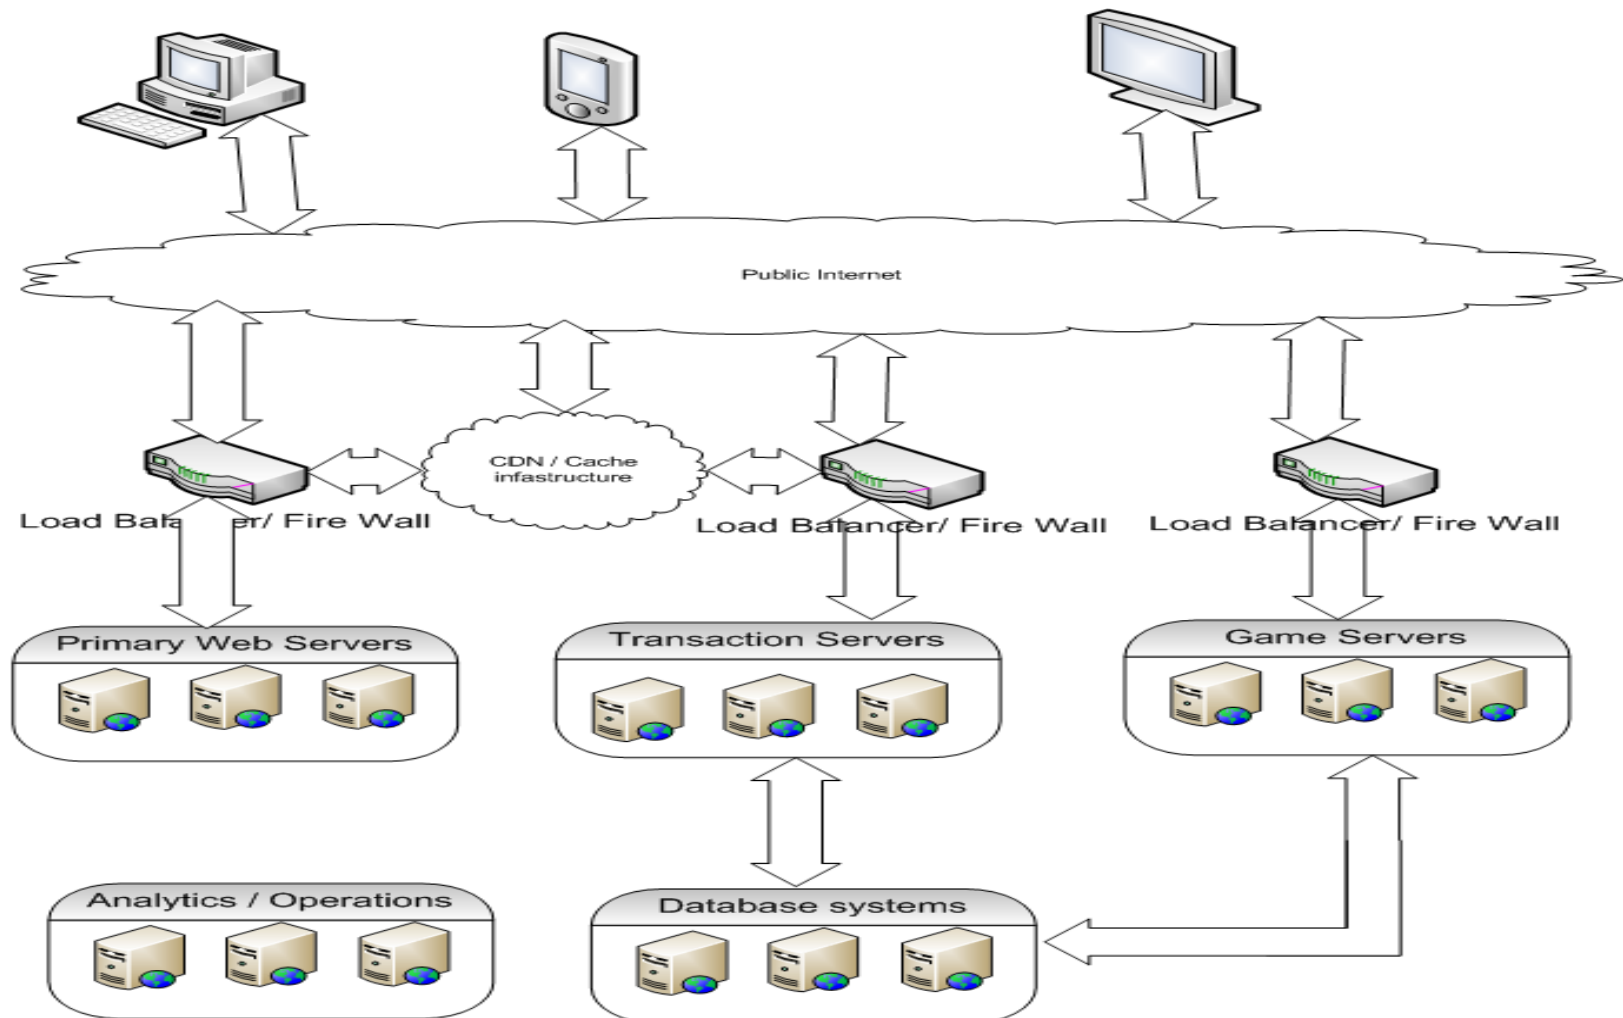

# I'm a geek and this a Technical Talk!

- ⌚ Talk about the technologies used.
- ⌚ Talk about the hard problems
- ⌚ Talk about a game server topology.
- ⌚ Technical - Approaches that have been taken at Disney Online Studios in the development of our MMO environments.

# A typical Disney environment

# Game Clients

Flash AS2–Browser–Web Assets

Panda 3D–Browser/Fat Client–Web/Local Assets

Flash AS3–Browser–Web Assets

Panda3D–Browser/Fat Client–Web/Local Assets

Flash AS3–Browser–Web Assets

# Client Communications

## ⊗ HTTP(s)

- ⊗ Preferred transport. Decoupled and stateless.

## ⊗ None HTTP = TCP.

- ⊗ We like the guaranties we get with TCP.
- ⊗ Accessibility is higher priority than latency.

# Primary HTTP Server Farms

④ HTTP is the first choice for infrastructure!

④ Load balance for scaling and resiliency

④ Cache are your friends.

④ HTTP is a commodity.

④ The world is optimizing.

④ PNG, SWFT, HTML, Patching files...

④ Streaming content and code...

④ 0 to N of these farms...

④ Linux, Apache, Squid, CDN's

# Transaction Server Farms

- ⊕ HTTP is the choice for low fidelity transactions.

  - ⊕ HTTP is a commodity.

- ⊕ Login, purchases, profiles, blogs...

- ⊕ Leader boards, achievements...

  - ⊕ 0 to N of these farms...

  - ⊕ Linux, Apache, Tomcat, PHP, Java

# Game Server Clusters

- ④ A series of machines and data storage used to manage the game logic.
- ④ Custom servers and server clusters.
- ④ Smart FOX servers – Heavy use of custom extensions.

Linux, Java, c++, Python

# Database Systems

- ⌚ Persistent storage.
- ⌚ Low bandwidth shared data.
- ⌚ Hot Redundancy.

- ⌚ 1 to N per environment.

- ⌚ MySQL, Oracle, Custom...

# Instrument servers

## ④ Record everything.

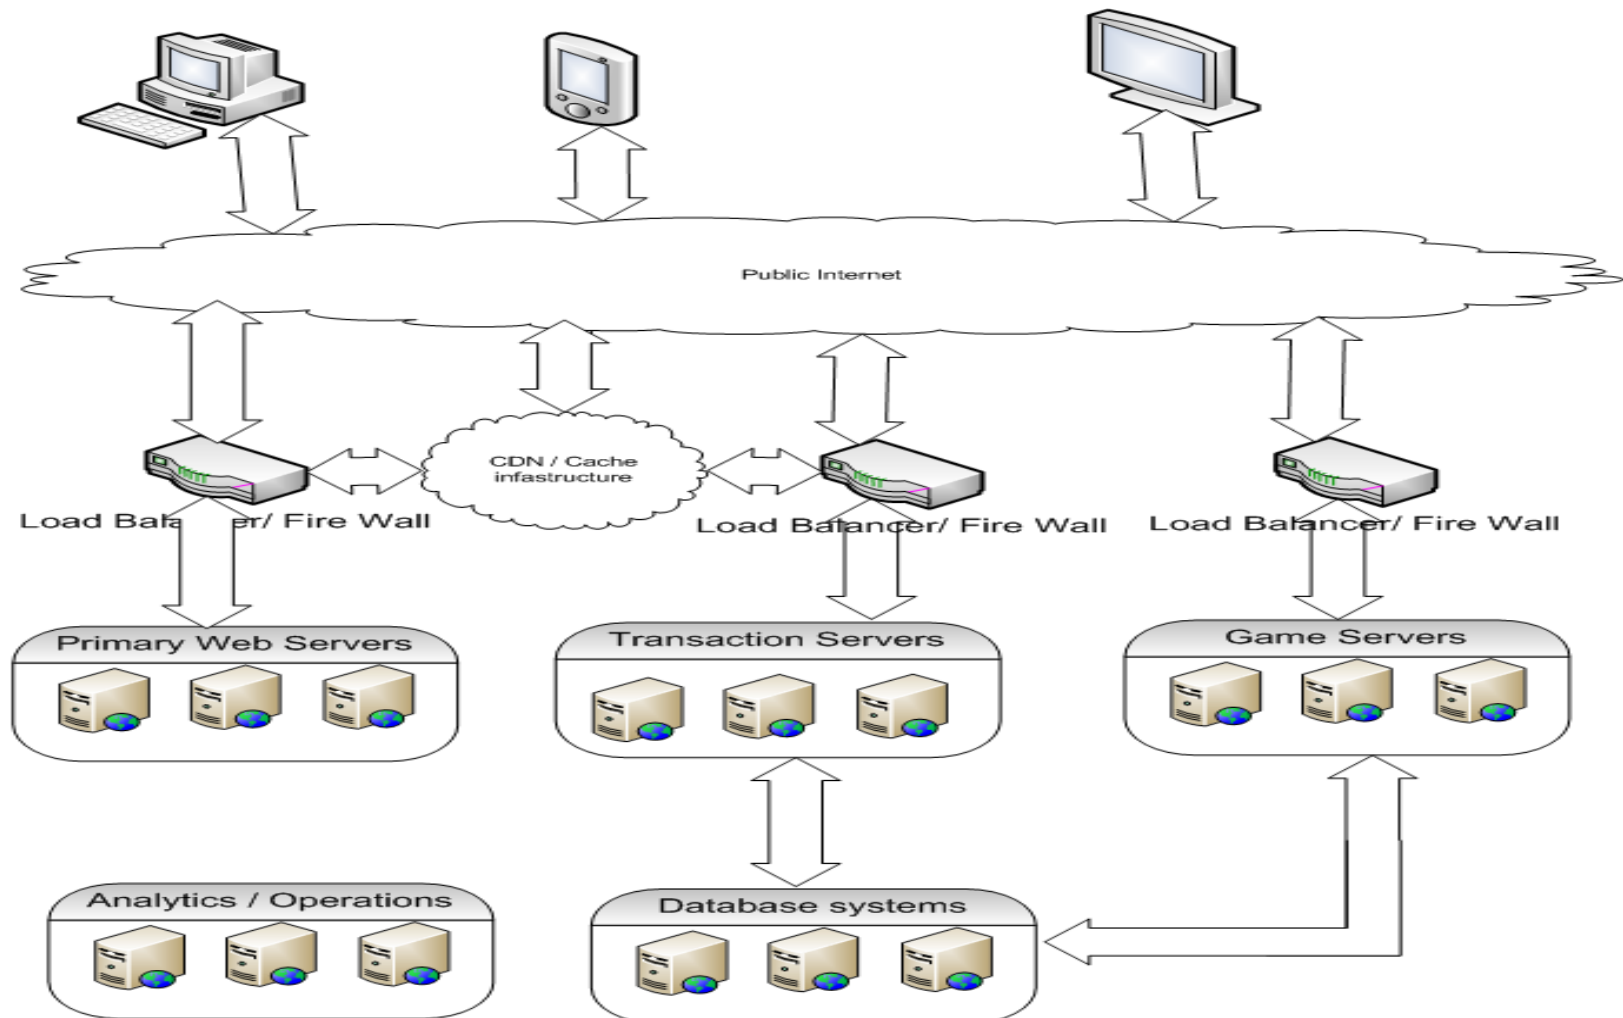

- ④ Game events and Accumulators.
- ④ OS/ Network/ disk... events and Accumulators.
- ④ Business event and accumulators.

- ④ When you think you have too much - add more.

- ④ Real-time access simplifies problem resolution.

# A typical Disney environment

# Let's talk about the hard problems.

- ⌚ Data - Rate of change
- ⌚ Data - Latency
- ⌚ Data - Size
- ⌚ Scaling
- ⌚ Security
- ⌚ Development
- ⌚ Resiliency

# Data - Rate of Change

- ⌚ The Data changes at a high rate.
  - 👤 Up to ~100ms.
  - 👤 Clients want this data fast.

Statefull solved with HTTP solutions.

Stateless solved with Push, not a PULL (HTTP).

- 👤 Late entry
- 👤 Early exit
- 👤 Delta Notification

- ⌚ Adopt the concept of a budget.
  - 👤 "Rate of Change is a budget problem."

# Data - Size

- ③ You have to move this over the internet.
- ③ You have to move this in memory(s).
- ③ You have to move this to and from disk.
- ③ Size really does matter.

③ "Data Size is a budget problem."

# Data - Latency

## ⌚ Get over it!

⌚ The internet is distance and distance is latency.

⌚ Adopt the concept of a Limit.

⌚ ~100 – 200 ms.

⌚ This will help other parts of the system and force all engineers to help address its existence.

⌚ "Data Latency is not a budget problem."

# Scaling

## ⌚ Make it Faster-Optimizing

- ⌚ Improved hardware and software

## ⌚ Replicate-Cache

- ⌚ Wider hardware and software = Farms.
- ⌚ Wider distribution = Cache is our friend.
- ⌚ Wider commercial distribution = CDNs.

## ⌚ Isolation

- ⌚ New disjointed Hardware - software
- ⌚ Just use a different.....

Not just expansion, contraction is important also!

Vertical

Horizontal

Depth

# Security

## ⌚ Do not trust the...

- ⌚ Client
- ⌚ Hosting software
- ⌚ Environment
- ⌚ ...

## ⌚ Ouch. I must trust them ?

- ⌚ Trust where you must
- ⌚ Verify
- ⌚ Audit

# Development = Big \$\$\$ and Time

- ④ MMO's are constantly changing
  - ④ Build infrastructure not direct solutions
  - ④ Build protocols not stand alone solutions
  - ④ Prefer loose integration over tight coupling
- ④ Tools Tools Tools
  - ④ Enable the right talent to do their jobs
  - ④ Get other disciplines out of their way
  - ④ Optimize the ownership pipeline
- ④ Allow for Federation!
  - ④ Simple ability to have a lot of environments active at once
  - ④ Only way to reasonably support disjoint development

# Resiliency.

Expect things to fail – Plan for it

Build it in.

- ⌚ Prefer Multi Master Model
  - ⌚ Else Replication
  - ⌚ Else Hot Spare
  - ⌚ Else ??
- 
- 🌐 Fail Soft not Hard!
  - 🌐 Ask early and often – “What happens when this fails?”

# The hard problems.

- ⌚ Have a budget ( size, speed)
- ⌚ Know the Limits ( latency, .....)
- ⌚ Scaling-Horizontal first.
- ⌚ Security–Trust and verify were you must.
- ⌚ Resiliency–scale from micro to monster size.

⌚ Dev  
⌚ Tr

id \$\$

# A Game-server Topology

- ⌚ Distributed Class systems
- ⌚ Messaging Bus
- ⌚ Network Culling
  - ⌚ Rooms/Zones
  - ⌚ Interest

- ⌚ Publish / Subscribe / Messaging

# Game-servers and the Clients

- ③ All Worlds all seamlessly accessible.
- ③ Change fidelity is high.
  - ③ Let's give the client what he needs when he needs it.
  - ③ It's all about pushing data to a client.
- ③ The data size is very large.
  - ③ Culling and statefull updates are required.

# Distributed Class System.

- ④ Most of our languages are class based, Fits very nicely.
  - ④ Language agnostic definitions and contracts.
  - ④ Contract for serializing, interest reflection, and high level security.
- 
- ④ Atomic and molecular data types.
  - ④ Data and Function signature and dispatching.
  - ④ Bindings for C++, Java, Python, Action Script, C#...
  - ④ Support for Class instance life cycle.
  - ④ Class asynchronous up calls.
  - ④ High level security and interest routing.
- 
- ④ Atomic generation, deletion, function dispatching, and document type messaging.

# Distributed Class System

```
⌚ struct BarrierData {  
⌚     uint16 context;  
⌚     string name;  
⌚     uint32 avIds[];  
⌚ };  
  
⌚ dclass DistributedObject {  
⌚     setBarrierData(BarrierData data[]) broadcast ram;  
⌚     setBarrierReady(uint16 context[2]) airecv clsend;  
⌚     execCommand(string, uint32 mwMgrId, uint32 avId, uint32 zoneId);  
⌚     broadcastMessage() broadcast;  
⌚ };  
  
⌚ dclass DistributedTestObject : DistributedObject  
⌚ {  
⌚     setRequiredField(uint32 r = 78) required broadcast ram;  
⌚     setB(uint32 B) broadcast;  
⌚     setBA(uint32 BA) broadcast airecv;  
⌚     setBO(uint32 BO) broadcast ownsend db;  
⌚     setBR(uint32 BR) broadcast ram;  
⌚     setBRA(uint32 BRA) broadcast ram airecv;  
⌚ };
```

# Room/Zone Base Divisions

- ④ Container used for grouping.
- ④ Entities/Instances exist in zones.
- ④ Pertinent game data is reflected to the zone observers.
- ④ We map important groupings to zones.
  - ④ Locations in the world.
  - ④ Groups of entities.
  - ④ Simple broadcast multiplexers.
  - ④ ...

# Simple and Complex Interest

## ③ Allow multiple interests to be active at once.

- ③ Location of the avatar is in.
- ③ Location the guild member are listening to.
- ③ Location all Tinker Fairies listen to.
- ③ Location of world population records.

## ③ Cut scene transitions.

- ③ Interest follows the avatar.
- ③ EOF indicator.

## ③ Smooth zoning transitions.

- ③ Multiple interest foreshadows the avatar.

# Zone + Interest = Network Culling!

- ⌚ Discovery, Filtering, Targeted groups...
- ⌚ Implemented with a messaging channel pattern.

- ⌚ Command message pattern.
- ⌚ Event messaging patterns.
- ⌚ Request-reply patterns.

# Channels=Phone System in the Cluster

- ④ 64bit .. Usually described as 2x32 bit values.
- ④ Point-to-point channels.
- ④ Publish-subscribe channels.
- ④ Data type Channels.
- ④ Interest type channels.
- ④ Game Clients have no access to channels.
- ④ Game Clients are function and DC driven only. ( security )

# Channels + DC = Functional Cluster

## ⌚ Channels.

- ⌚ Instance Channel.
- ⌚ Locations Channel.
- ⌚ Owners Channel.
- ⌚ Controlling AI Channel.
- ⌚ Persistent Store Channel.

## ⌚ DC Class Definition.

How to read/write.

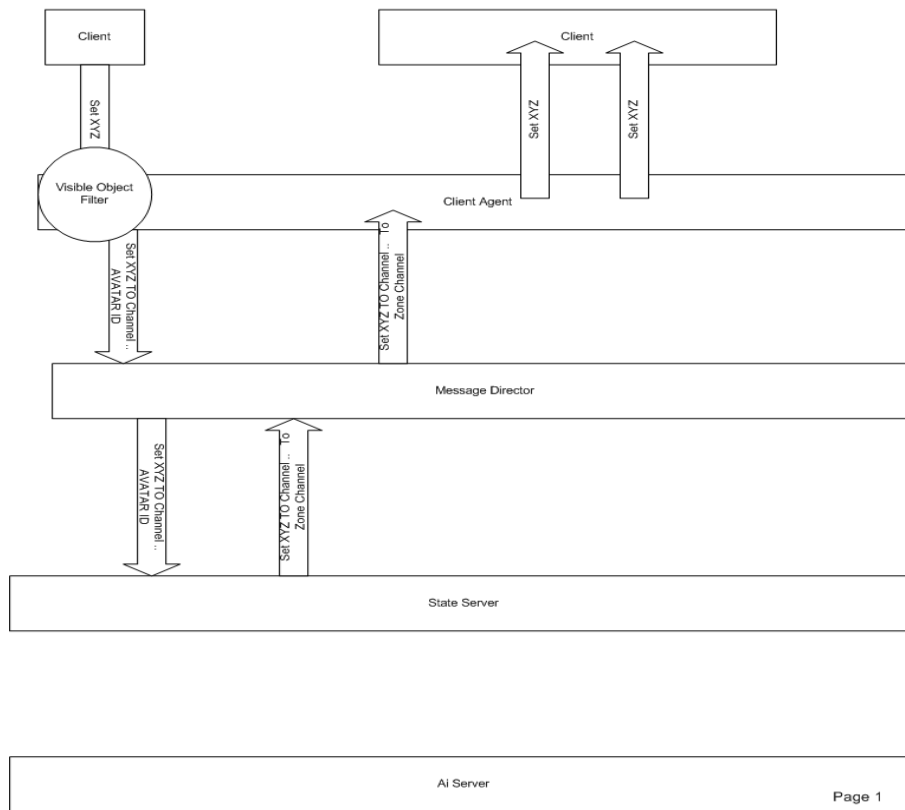

What to do with it.

# Logical system

## Example Of Broadcast Message

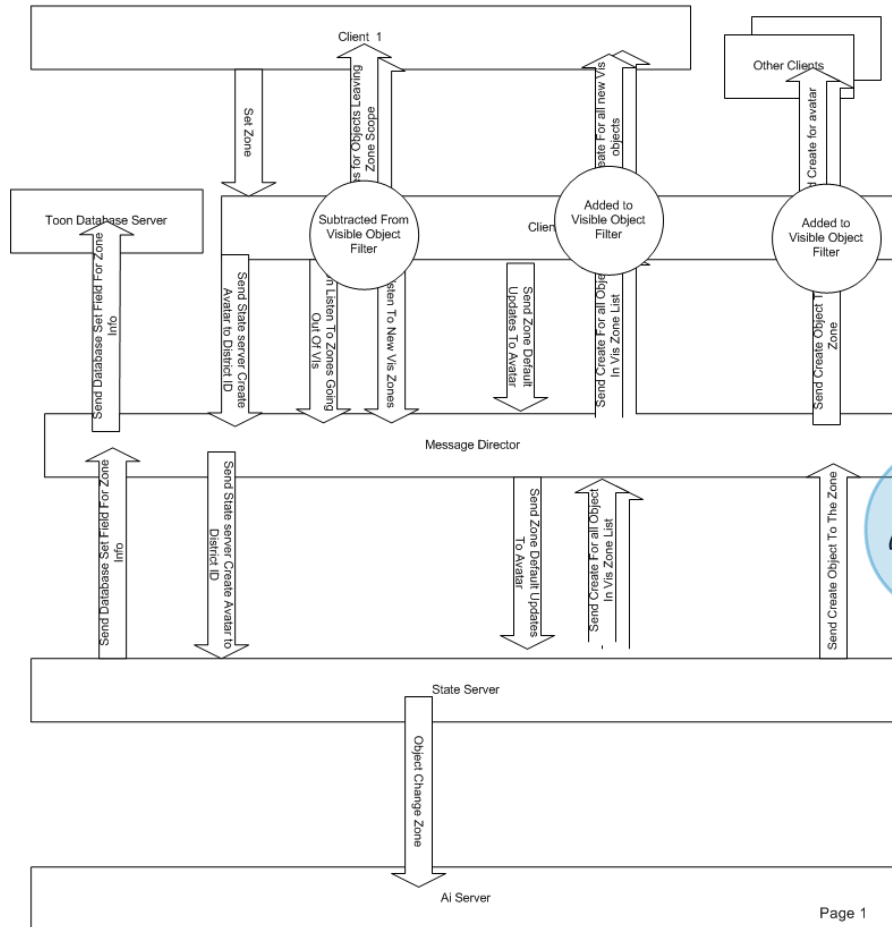

The Key is that all client agents listen to the channel assigned to a zone. Broadcast are just dc update commands targeted to a zone not an object.

# Asynchronous very finite units

### Example of a Change Zone For A avatar

1. A Zone list is provided in the set zone message. All objects in these zones send a Create with other back to the connection.
2. The create for the new avatar is sent to the zone channel he is in.

# What are DC Classes

- ⌘ Avatars.
- ⌘ Game object .
- ⌘ A world.
- ⌘ Every physical process.
- ⌘ RPC type services.
- ⌘ ....
- ⌘ We like classes better than function dispatching.

# What are Channels.

- ⌚ Every distributed object has a channel.
- ⌚ Every Account has a unique channel.
- ⌚ Every guild, group...

- ⌚ A channel is like a phone number. If you want to talk to it you use the channel.

# A Game-Server Topology

- ③ Distributed Class systems.
- ③ Messaging Bus.
  - ③ It's not a hierarchy it's a cloud.
- ③ Network Culling.
  - ③ Rooms/Zones.
  - ③ Interest.
- ③ Persistent store is not linked to update.
  - ③ Asynchronous.
  - ③ Memory image with a trickle writer.
  - ③ Update merging.

# General Rules for Server Systems

- ④ Commodity before proprietary.
- ④ Protocol over library.
- ④ Asynchronous over synchronous.
- ④ Process over threads.
- ④ Horizontal over vertical scaling.
- ④ Loose coupling over tight integration.
- ④ Fail soft!!!!
- ④ Optimizing game development life cycle is critical.
- ④ Have a budget.
- ④ Classes over functions.
- ④ Keep it as simple as possible.

④ Let the problem pick the technology!

# War Stories (time allowing)

- ⌚ You own it.
- ⌚ Fake it.
- ⌚ Know the real question.
- ⌚ Hidden Races
- ⌚ DBMS replication is for recovery, not performance.

# Questions?
