

Using the Power of Layered Animation to Expand Premium Content in Battlefield 4

Ryan Duffin

Senior Animator, EA DICE (Los Angeles)

Goals of the talk

- Story/post-mortem of a feature

Goals of the talk

- Story/post-mortem of a feature
- Solving problems unique to adding features to a shipped game

Goals of the talk

- Story/post-mortem of a feature
- Solving problems unique to adding features to a shipped game
- Not too high level

Goals of the talk

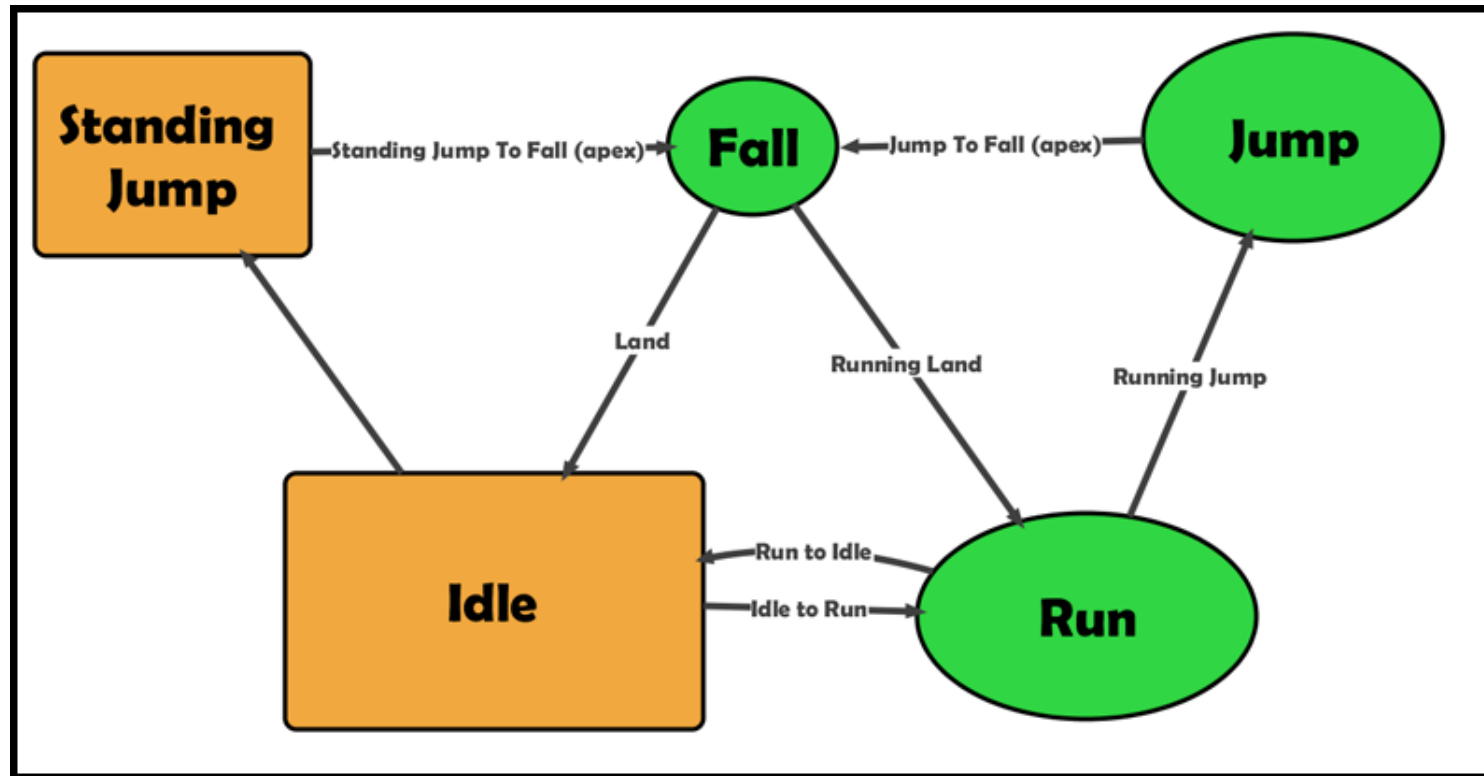

- Story/post-mortem of a feature
- Solving problems unique to adding features to a shipped game
- Not too high level
- Not too low level

What are Additive & Layered Animations?

- Ways to add, subtract & otherwise modify an animation while still preserving it's original integrity

What is a State Machine?

What is a State Machine?

What is a State Machine?

Why do layers & additives matter in games?

- PS2/Xbox action game animation counts:
 - 20-80+ per character?
 - Idles & Fidgets
 - Directional movements
 - Combat
 - Transitions(?)

Why do layers & additives matter in games?

- PS2/Xbox action game animation
 - Unique, hand-keyed animation sets
 - Unique skeletons
 - Not as much need to share animations
 - Achievable with smaller teams

Why do layers & additives matter in games?

- PS3/Xbox360 animation counts: Hundreds or even in the thousands!
 - More states + more fidelity = exponentially more transitions

Xbox360/PS3 Games Animation

- Pros
 - Our games look and move better than ever
- Cons
 - More complexity & expense (fiscal & memory)
 - Animation scope less forgiving of variety in skeletons & character-specific movesets

Downsides of “next gen”

The Battlefield 4 Animation System

- Many layers running concurrently
 - Some blend (override), some additive
 - Idle animations, aiming, hit reacts
 - Basic locomotion sets

The Battlefield 4 Animation System

- Basic animation “families”
 - Based on weapon type/posture
 - Pistol, Rifle, Anti-Tank, Hand etc
- Unique weapons in 3p via additives to these sets
 - Streamed in client-side; only loads what sets are used

What happens when design asks for
something that doesn't fit?

Ballistic Shield!

- Shield and handgun combination

How to make these...

...into this:

Risks

- How long will it take?
- Worth the time & effort?
- Asset archaeology
- Can we match the existing quality bar for animation?

Approach #1: New anim set

- Full, bespoke animation set/weapon type
 - Shield as a new weapon type
 - Based on existing source files

Approach #2: Layers

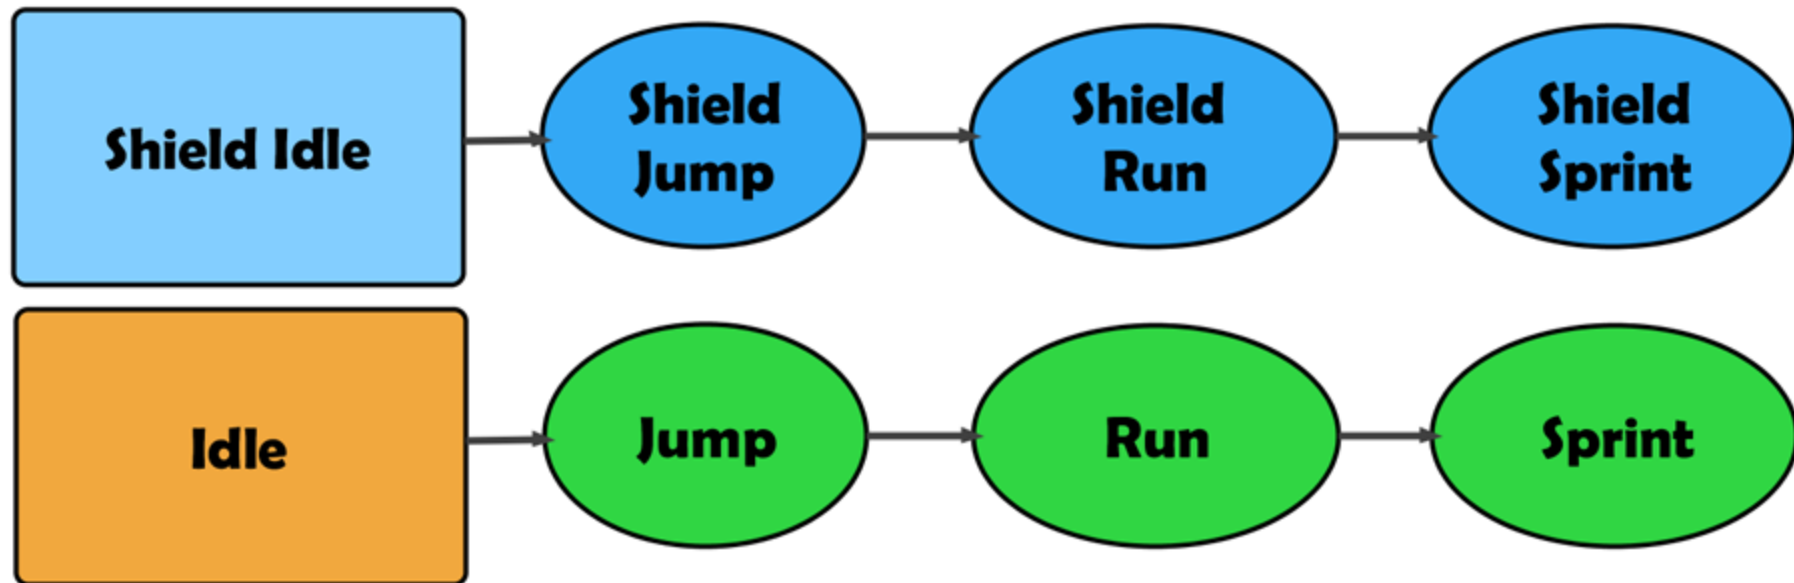

Approach #2: Layers

- The Layers/Additive approach
 - Add a corrective layer to an existing anim set
 - Heightened awareness of memory budget

Additive Shield Pose?

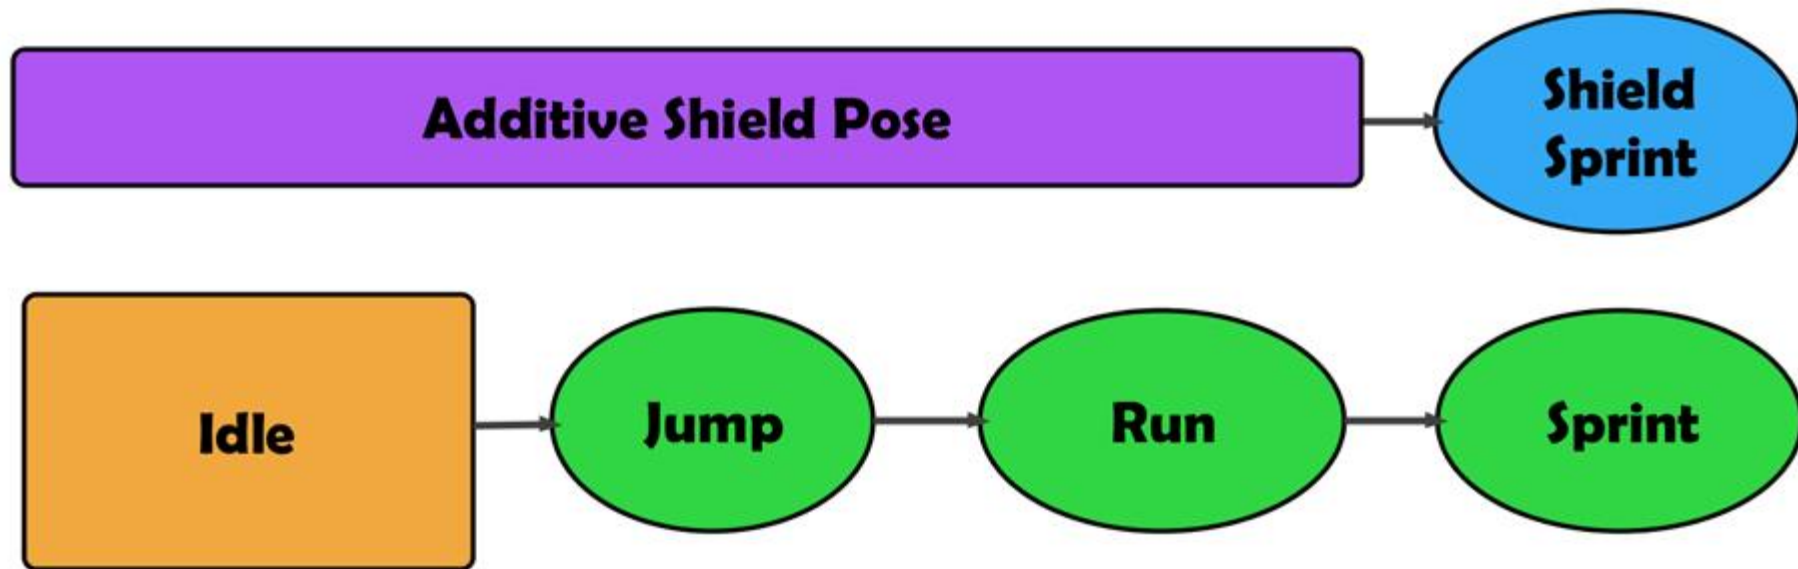

Approach #2: Layers

Approach #2: Layers

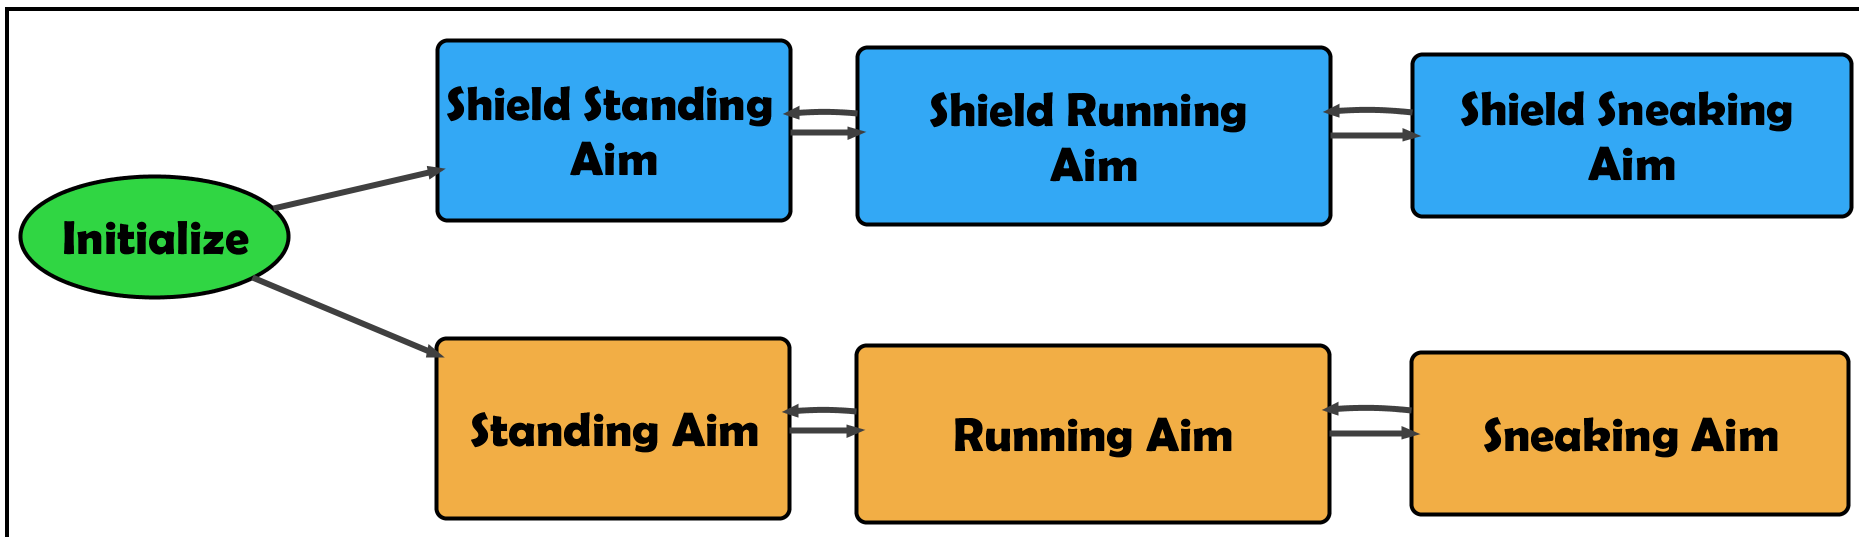

Approach #2: Layers

Approach #2: Layers

Aim Up and Down Layer

Approach #3: Bargaining

- Arms only blend/override layer?
- Left arm only blend layer?
- Left arm only, no fingers?

Approach #3: Bargaining

- Risks
 - Stateflow cost still exists
 - Increased risk of exceptions/glitches
 - Keeping source files synced
 - Running out of time

Other compromises

- Shield, no pistol
 - Pros:
 - Unique anim set no longer required
 - Best chance to “Save the patient”
 - Solves the UI/progression problems
 - Solves “partial exposure”
 - Dramatically reduces design & balancing variables

Other compromises

- Shield, no pistol
 - Cons:
 - Was it worth it?
 - Would it still be fun?
 - Were we bringing enough new to the table?

Approach #4: Shield only

Approach #4: Shield only

- Risks
 - Still very much not like a weapon in proportions
 - Will any existing animation set accommodate this?

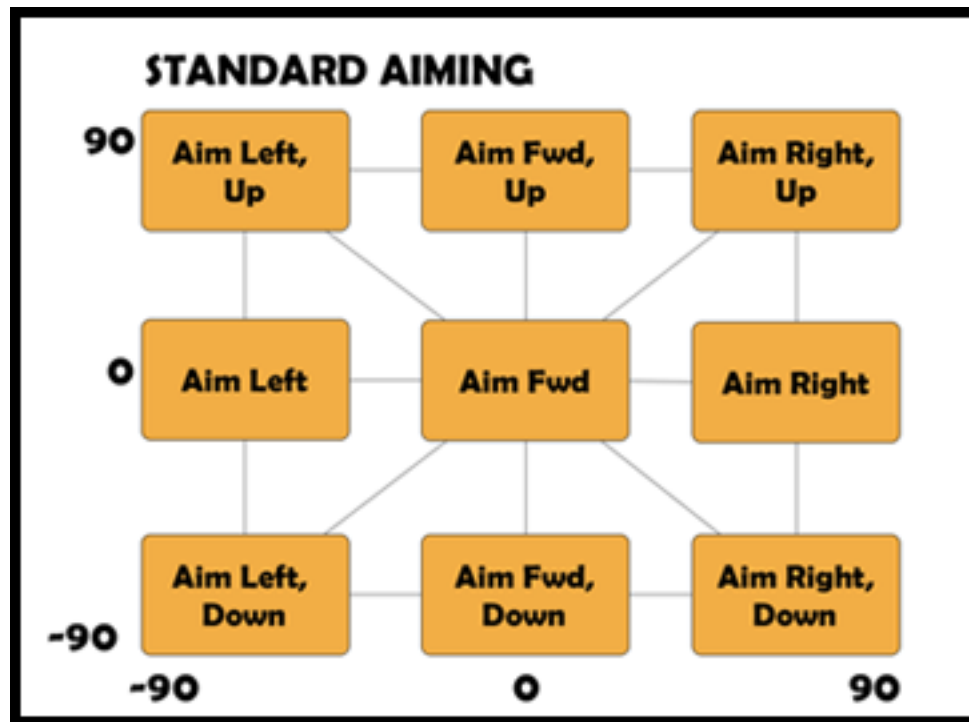

Approach #4: Shield

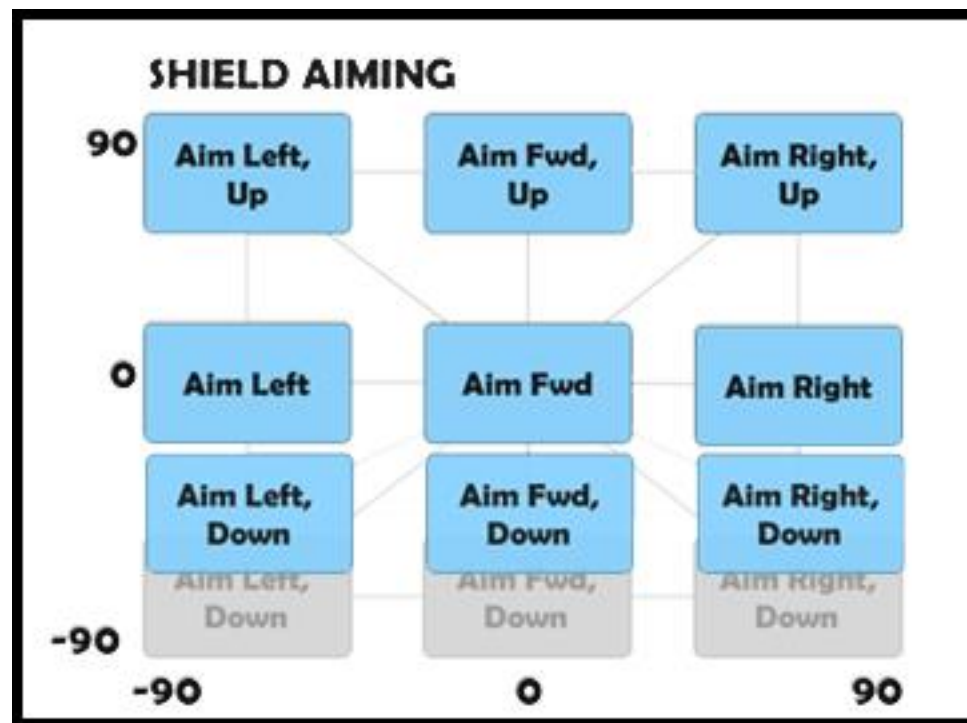

Approach #4: Shield

- Solutions:
Aiming

Approach #4: Shield

- Solutions:
Aiming

Approach #4: Shield

- Solutions: Shield Bash/Melee Attack
 - New fire animation in 1st person: bash
 - New stateflow offshoot in 3rd person:
 - Reload layer=full body, blend
 - Melee could be full body!
 - Had to stay mostly in-place/no pushback
 - Damage=point blank range “shot”

Approach #4: Shield

- Solutions: Sprinting

Approach #4: Shield

- Solutions: Sprinting

Approach #4: Shield

- Solutions: Sprinting

Approach #4: Shield

- Solutions:
Ladders

Approach #4: Shield

- Solutions:
Pointing

Approach #4: Shield

- Solutions:
Pointing
