

Next Level Creature Sound Design

David Philipp

Co-Owner at The Noiseworks Ltd.

Sound Designer/Recordist at BOOM Library

Previously Senior Sound Designer at
Creative Assembly Ltd.

Overview

- Introduction
- Initial Thoughts
- Pre-Production
- Recording
- Design
- Implementation

Introduction

- David Philipp
- Co-founder of Noiseworks Ltd.
- BOOM Library recordist/designer
- Worked on large amount of creature heavy titles
- Elder Scrolls Online, Blade and Soul, Arcania
- Leading creature SFX for Total War: Warhammer

Initial Thoughts

- What's my role as a creature sound designer?
- What makes a creature more difficult than other sound effects?
- Is there a difference between producing creatures for interactive and linear media?

The Three Ingredients Of Great Creature Sound Design

- Character
- Variation
- Perspective
- Equals believability and immersion

© Various snippets from YouTube videos

Pre-Production Basics

- Pre-Production one of the most important aspects
- Mostly overlooked and forgotten about
- You need to be aware of what you work on
- And what material you want to use
- One can't paint without colours..
- If you are freelance or with a developer doesn't matter

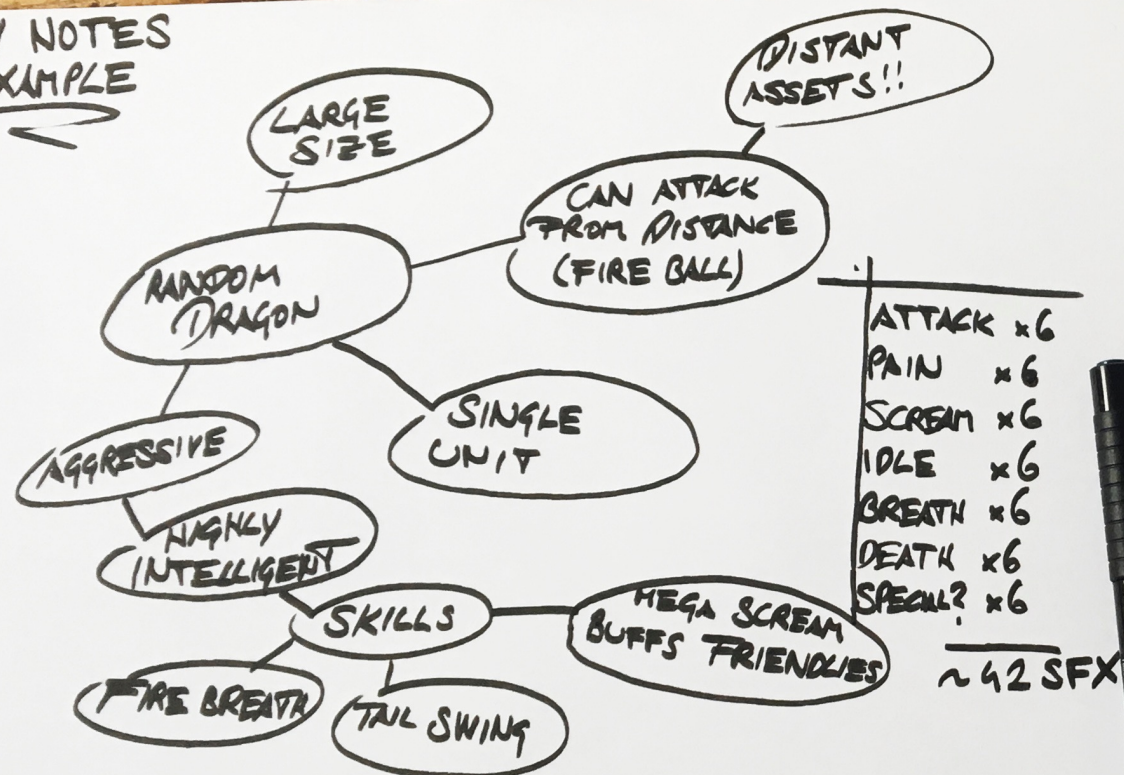

Pre-Production Advanced

- Find out the creatures origin, special characteristics and skills
- How does it produce sound in the first place (voice box, chest cavity)
- Is there need for a language?
- Size and their scale in relation to other creatures in-game
- What and how many articulations do I actually need?
- All this will come together and define the sonic character of your creature

NW NOTES
EXAMPLEPOTENTIAL RECORDINGS

HUMANS

RECORD DAVE - CRAZY

INWARD SQUEAL

BYRON - HIGH PITCH SQUEAL

JACK - SOUNDS LIKE
A PIG

...

ANIMALS

PIGS (SQUEALS, GRUNTS)

HORSES

DONKEYS

SQUIRREL MONKEY

ELEPHANTS

WALRUS?

...

MISC / N.L

DRY ICE ON METAL

CELLOPHONE / RUBBER

DOOR CREAKS (HAMPSHIRE)

GUITAR STRING SCRAVES

...

Recording

- Different mics = different results
- Literal approach - humans
- Literal approach - animals
- Non-literal approach

Microphones

- Sanken CO-100k
- Sennheiser MKH series (8040s, 8050s)
- Contact mics

Sanken CO-100k

- Most powerful weapon of a creature sound designer
- Picks up signals up to 100kHz (192kHz recording)
- Therefore is a dream for pitching audio
- (Unfortunately) it's an omnidirectional mic
- It stops working below 10c

Example Sound

Sound recording with the Sanken CO-100k

Sennheiser MKH-series

- Great allrounder
- A very popular choice for recording in the field
- Picks up signals up to 50kHz
- Which is still great for pitching purposes
- Is available as cardioid/super cardioid and therefore a great MS solution

Example Sound

Sound recording with the Sennheiser MKH 8040

© Noiseworks & BOOM Library 2017

Contact mics

- Not too pricy and normally very durable
- Great way to pick up “different signals”
- Can sound super odd, dependent on the source and placement
- Picks up very dry and isolated signals
- Big difference between budget and high-end solutions

Example Sound

Sound recording with the Barcus Berry

Human recordings

- A powerful source, especially with the Sanken
- Humans (usually) perform on command and can be directed
- Can be recorded in a controlled environment
- Unless you hire actors, it can be done quite cheaply

Human recordings

- After recording loads of different human sounds it can sound very similar once they are pitched/slowed down
- Variation is always key
- Humans complain about sore throats and hoarseness
- (It's not as much fun)

Animal recordings

- Can be very rewarding as certain animals produce great and powerful sounds
- Difficult to achieve, most animals don't make noises on command
- Time consuming
- Mostly outdoors, uncontrolled environment

Animal recordings

- Sometimes animal recordings are absolutely necessary
- Certain sounds can hardly be reproduced by humans (horses, bears, vultures, seals etc.)
- Can be very pricy if agencies have to be involved
- Those recordings can be dangerous (panthers, stags, lions)

Animal recordings / Planning and Execution

- Where am I recording?
- Is it possible to do a reccie beforehand?
- What am I recording?
- How much do I think I can get out of it?
- How dangerous is it going to be?
- What equipment do I need? Better take too much than not enough

Listening test for the audience

SOUND NR 1

Which file is made just of human sounds?

SOUND NR 2

Non-literal approach

- Some of the best layers for creature sounds don't have to come from humans or animals
- Think about tire squeals, door creaks, balloon stretches, dry ice on metal, high-pitched scrapes etc.
- Look for sounds, not for props!
- It can add another layer of interest to the creature
- And make it sound different to everything else

Non-literal approach

- Creatively the biggest challenge
- But also the most rewarding
- Very time consuming
- Finding the right spots and props to record can be very difficult

Design

- The process where it all comes together
- Ideally you'd know what you're trying to achieve by now
- But sometimes it can feel more like throwing paint on a canvas and seeing what happens
- The DAW of your choice is **not** important (unless you have to collaborate with other people)

Design

- Creature sound design consists of layers
- Hardly ever there will be one sound which is enough
- The art is to make all the different layers work together and sound like a homogenous creature
- Focus your attention on the tonal relation between the different layers (pitch)

© Noiseworks & BOOM Library 2017

Design

- Approaching those designs can be a bit like arranging music
- Pitch matching is most important and plug-ins can't take that work off you
- Good source can allow you to work with just volume and EQ
- There's still plug-ins out there which are a must have for every (creature) sound designer

Plug-Ins

- Izotope RX (Advanced)
- Zynaptiq Morph II
- Zplane Elastique Pitch
- Maag EQ
- Waves Lo-Air
- Krotos Dehumaniser 2

Implementation Basics

- Last part of the process (apart from the mix)
- If the implementation is bad even the best sound can't save it
- We are dependent on great systems for our sounds to make them shine properly
- Implementation is 50% the experience!
- There's countless possibilities of implementing audio

Implementation Tips

- Hierarchy setup is incredibly important
- Modular approach vs. one-shots
- Distant vs. close assets
- Use of cone attenuation
- Volume = size, make use of it
- Sweetener layers (proximity)

Summary

- Pre-Production is key, know what you're working on
- Be creative with the recording process but sometimes the most simple approach can get the most satisfying result. Trial and error!
- Pitch matching, EQ and volume. Those three ingredients work with good source!
- Get stuck into implementation if you can. If you're freelance, at least try to get involved
- **Believability** and **character** = most important aspects of creature sound design

Thank you very much for your attention!
