VIRTUAL REALITY DEVELOPERS CONFERENCE
MARCH 16-17, 2020 | #GDC20

What is this Talk?

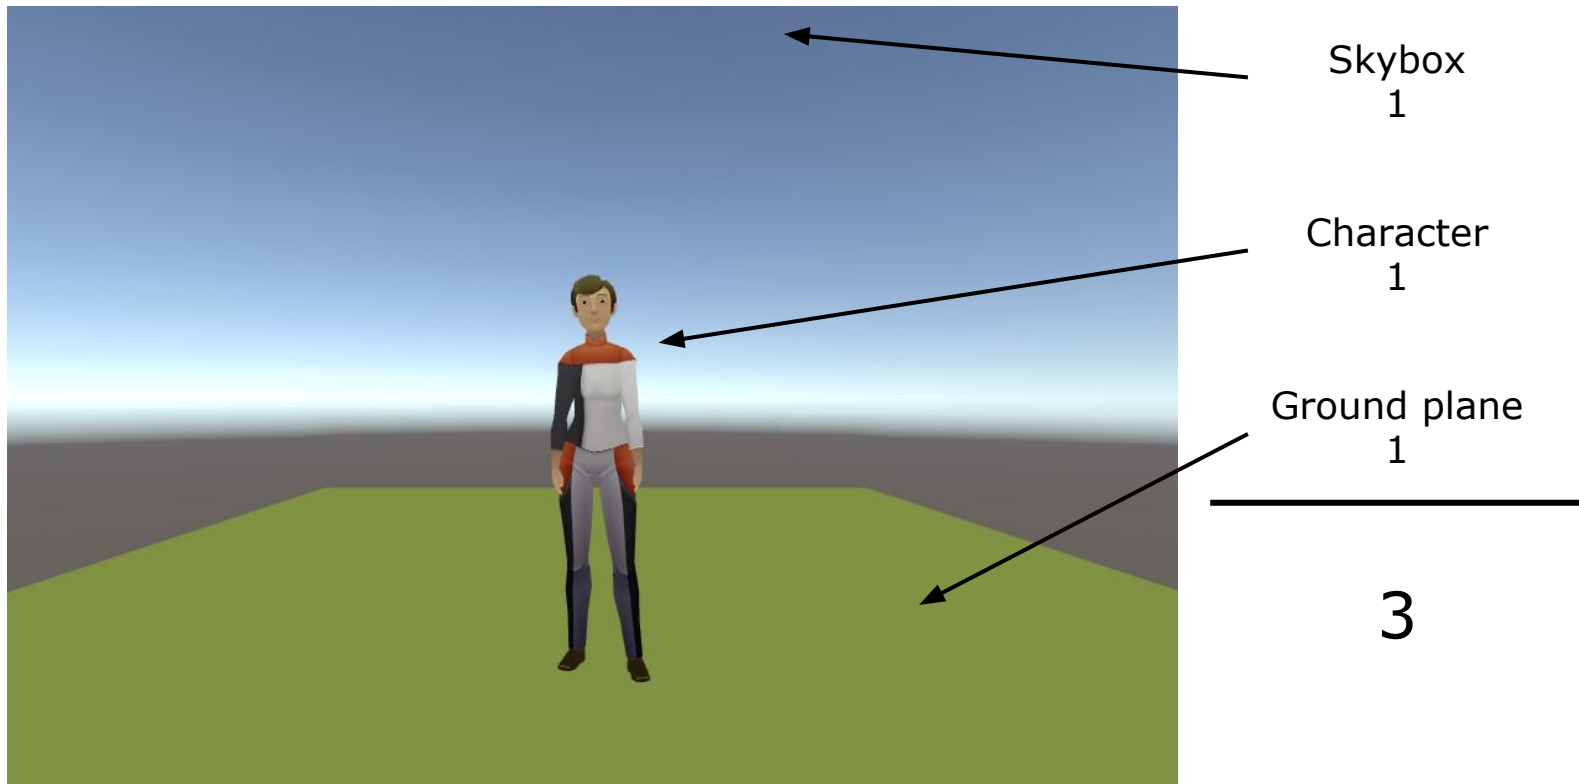

The Quest!

Let's Talk About Draw Calls

DrawCalls

DrawCalls

DrawCalls

- 1 Call per mesh/object
- 1 Call per unique material (or material instance) on that object
- Limit number of materials on a mesh
- Atlas textures to reduce number of materials
- Merge meshes where you can

Tools for Art Performance

RenderDoc

- Uses connection to the Quest to capture a frame as the Quest would draw it
- See total number of draw calls
- Step through individual draw calls
- Find potential problems for performance.

RenderDoc

Draw Call Number

These are the individual draw calls, ok

The screenshot shows the RenderDoc application interface. At the top is a timeline for frame #462. Below it is the Event Browser, which contains a table of draw calls. A red box highlights the first 22 draw calls, which are all 'glDrawElements' calls. A red arrow points from the 'Draw Call Number' text to the 'Draw #' column of this table. A grey bracket on the left side of the table groups these 22 calls. The 23rd draw call is highlighted in blue. To the right of the Event Browser is a 3D scene view showing a garden with a gazebo and a path. A pink box highlights this view. To the right of the 3D view is a panel showing the texture being used in the selected draw call, 'Texture2D_E1F865EE = GardenGradient'. A red arrow points from the text 'Hey cool, the textures being used in this call!' to this texture panel. At the bottom of the interface is the API Inspector, which shows the specific OpenGL commands for the selected draw call.

EID	Draw #	Name
301	4	glClear(Color = <0.659756, 0.85765...
303	5	Set RenderTarget
305-380	5-47	Render Opaques
306	5	Render Opaques
308-378	5-46	RenderLoop.Draw
332	5	glDrawElements(1272)
342	6	glDrawElements(2604)
352	7	glDrawElements(780)
362	8	glDrawElements(4368)
363	9	glDrawElements(252)
364	10	glDrawElements(1728)
374	11	glDrawElements(22008)
375	12	glDrawElements(43194)
385	13	glDrawElements(110928)
395	14	glDrawElements(13392)
405	15	glDrawElements(9576)
406	16	glDrawElements(2604)
407	17	glDrawElements(2976)
408	18	glDrawElements(1512)
409	19	glDrawElements(252)
410	20	glDrawElements(2640)
411	21	glDrawElements(6144)
421	22	glDrawElements(6144)
431	23	glDrawElements(22008)
432	24	glDrawElements(144)
442	25	glDrawElements(2640)
452	26	glDrawElements(109200)
462	27	glDrawElements(4344)
472	28	glDrawElements(13392)
473	29	glDrawElements(2982)
474	30	glDrawElements(3420)
475	31	glDrawElements(112182)

This is what the render looks like at this point in the calls

Hey cool, the textures being used in this call!

OVRMetrics/ FPS Counter

- FPS is the most important indicator of performance!
- Ideally keep it at 72, but at least above 65
- Use a FPS counter to see what the framerate is at runtime

OVRMetrics/ FPS Counter

The Basics

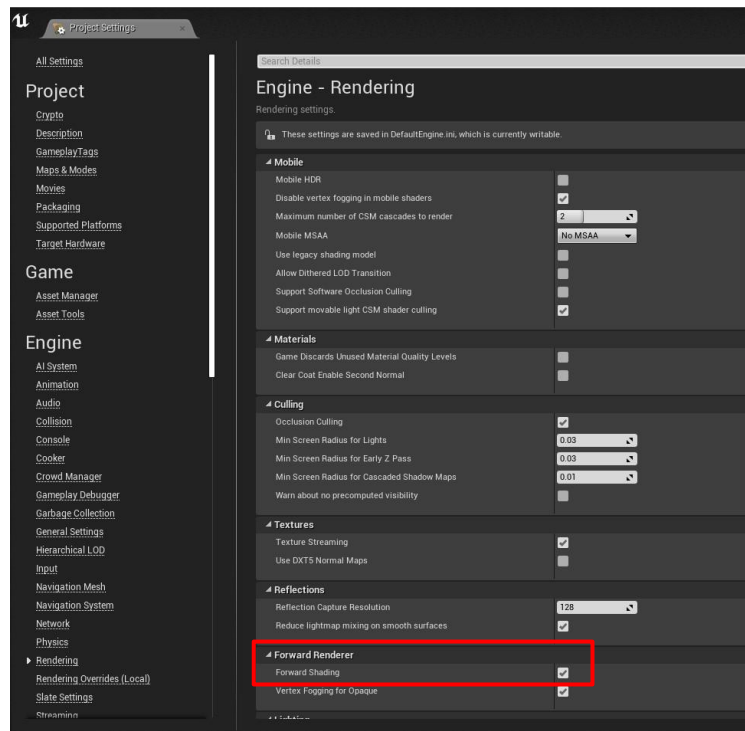

The Basics

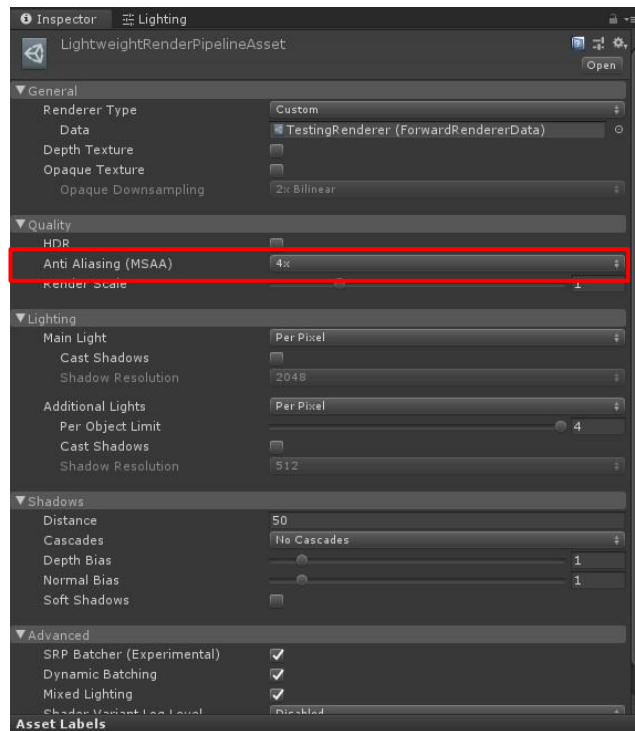

- Use Forward Rendering
- No Depth Rendering
- Single Pass Stereo
- Anti-Aliasing
- Fixed Foveated Rendering

Forward Rendering

Unreal

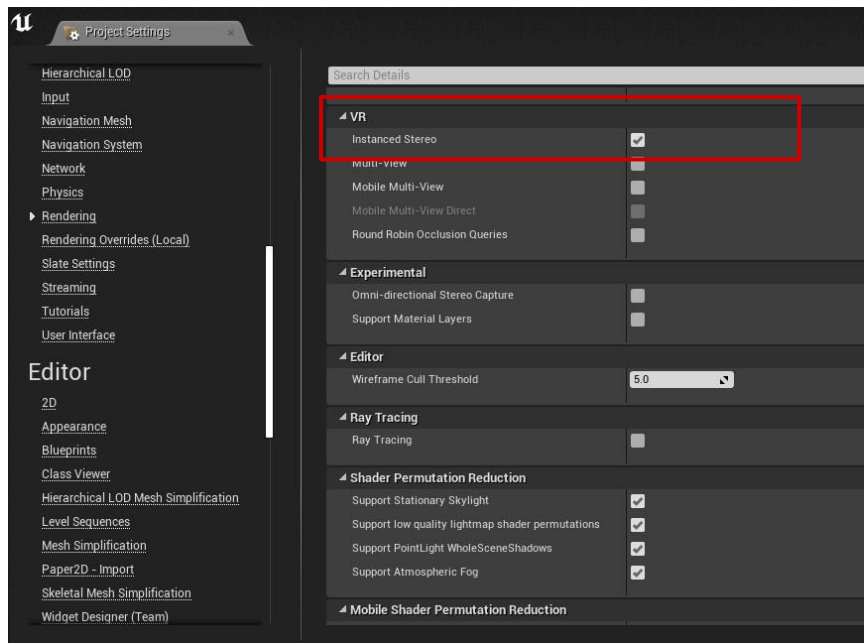

Unity

Depth Pass

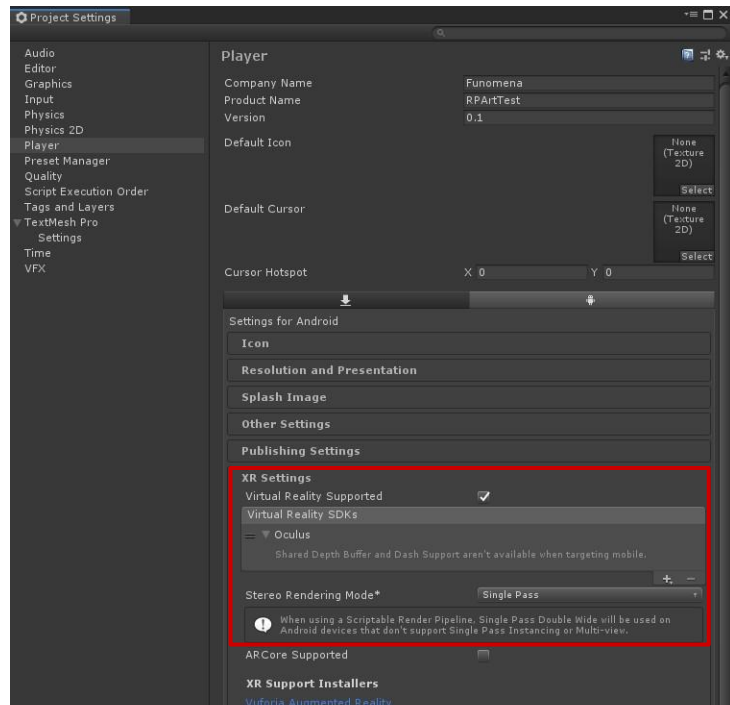

- Nope, sorry

Single Pass/ Instanced Stereo

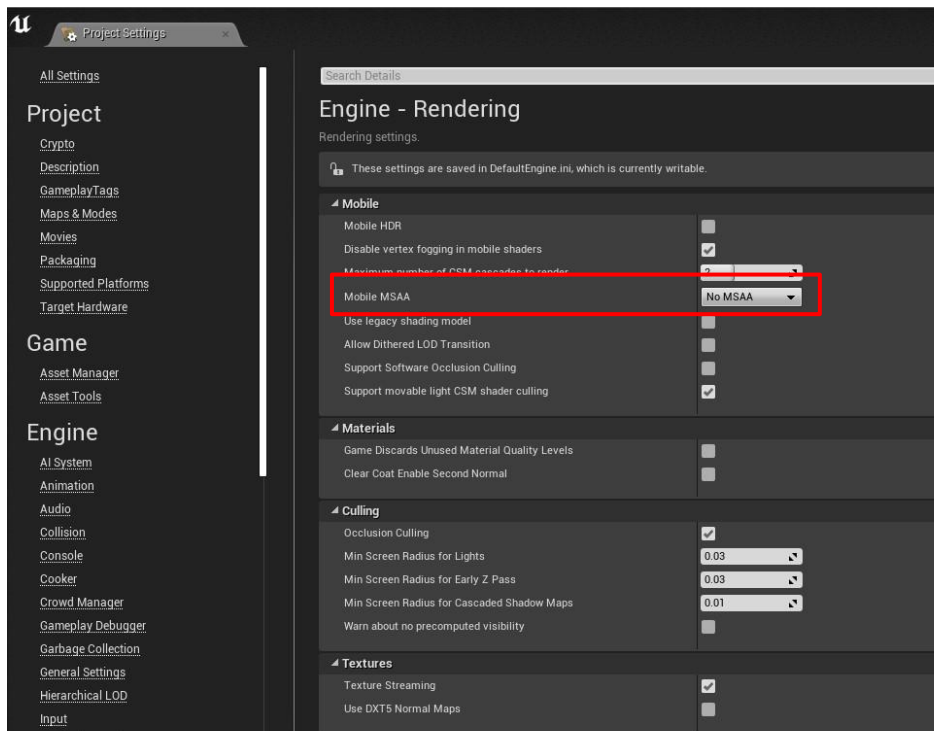

Unreal

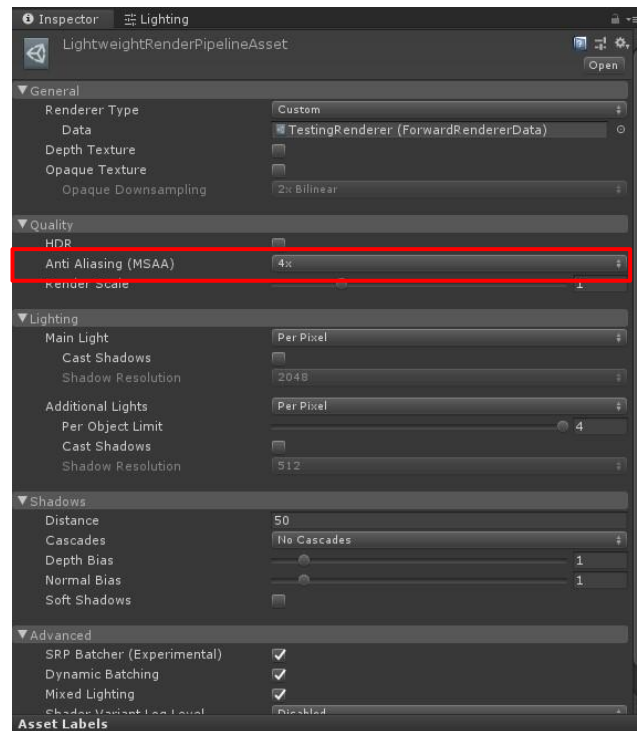

Unity

Anti-Aliasing

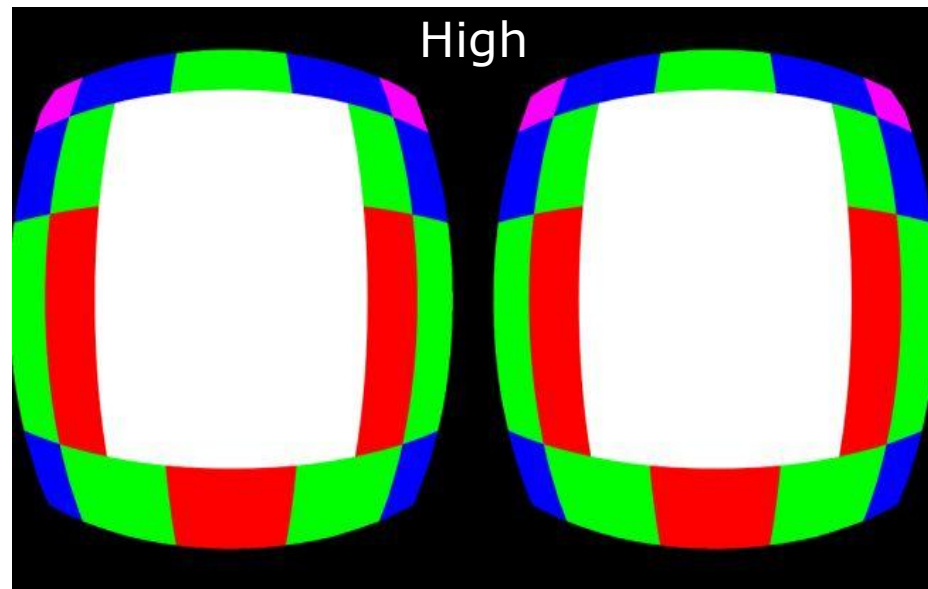

Unreal

Unity

Fixed Foveated Rendering

Fixed Foveated Rendering

Lights and Shadows

Lights and Shadows

Vader Immortal
ILMxLAB

Moss
Polyarc

Fisherman's Tale
Vertogo Games

Half & Half
Normal

Lights and Shadows

- Bake lights to get more performant lit looks
 - But remember that baking lightmaps takes time!
 - Balance time against team size and number of environments
- Only one dynamic light at a time
 - Consider baking in static areas anyway

Lights and Shadows

- Dynamic shadows are really expensive
 - Only one shadow casting light at a time
 - Only hard shadows
 - Avoid if possible, unless game is rendering VERY lightweight

Lights and Shadows

Bonfire
Baobab Studios

Half + Half
Normal

Lights and Shadows

Virtual Virtual Reality
Tender Claws

GNOG
KO_OP

Lights and Shadows

- Unlit shaders perform really well
 - Eliminate time spent lighting and baking lightmaps
 - Can require less textures overall
- Lit, but cel-shaded as an alternative
 - Less to compute without going fully unlit

Shaders, Materials, and Textures

Textures

- Keep texture resolutions low
- Use as few maps as possible
- Perhaps try going without certain maps, or packing into RGBA channels
- Reuse and tile what you can
- Don't forget your mip levels!

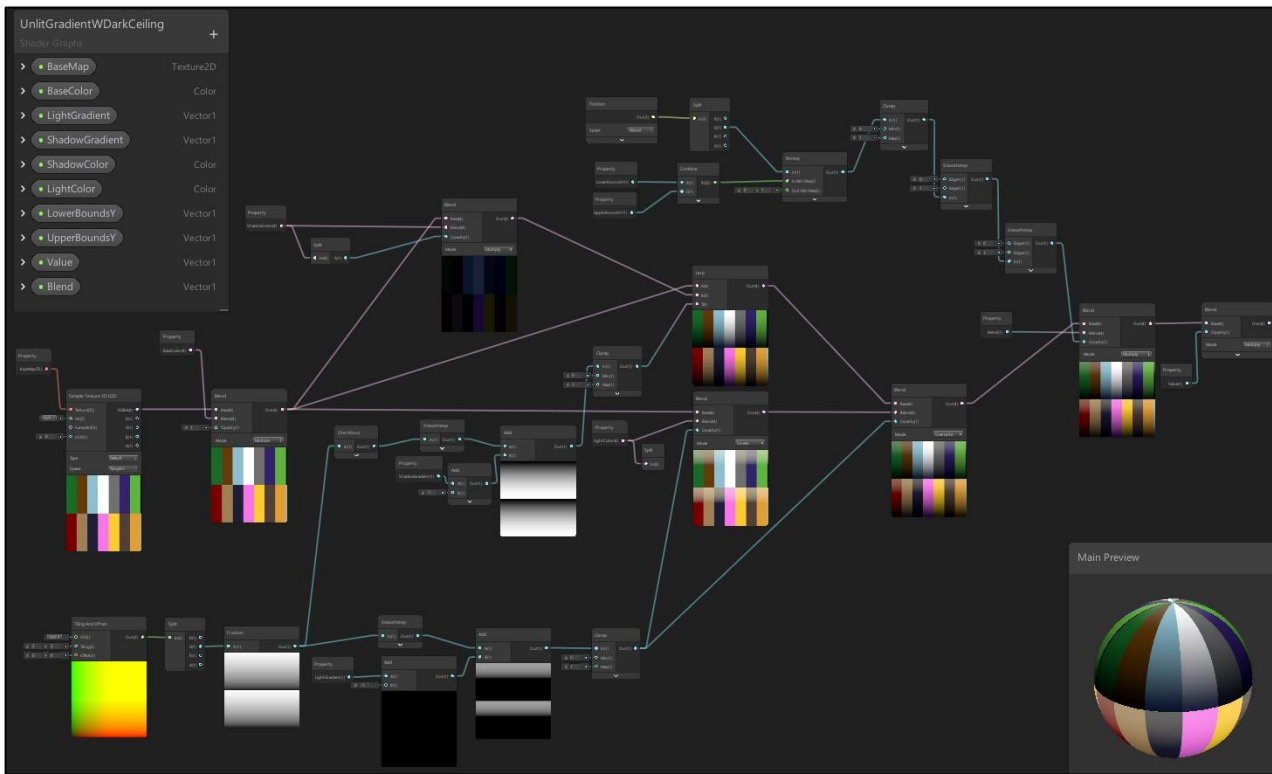

Shaders

- Number of instructions impact performance
- Number of textures impact performance, especially if they tile across the screen
- But shaders can also be really helpful to create beautiful and unique looks
- Experiment with lightweight shaders and see what unexpected work they can do

Shaders

Materials

- Switching materials and shaders has a slight performance hit per draw call
- Atlas what you can to reduce number of unique materials, even if it won't reduce draw calls
- Consolidate shaders if you can to limit the number of unique ones

Poly Count

Poly Count

FPS: **63**

Poly Count:
500K Verts

Poly Count

- Instancing in memory only does not reduce draw calls
- *Some* kinds of instances DO combine/batch draw calls
- LODs are still there, and still work!
- Some kinds of instances also use LODs *and* batch draw calls

Poly Count

- Use good industry practices, especially when working from high to low poly
- Explore new styles!
- Integrate useful and applicable low-poly stylizations into your game as solutions for difficult problems
 - Example: Look at how trees or foliage are handled in low poly styles, if you're having trouble with performance using traditional methods.

SUPERHOT

Batching

Batching

All the cards in the particle systems are drawn on this call

Dust motes

Batching

- Draw multiple objects on one call!
- Different types and methods in different engines
- All come with a little overhead you should keep in mind
- Figure out if its cheaper to batch or use another solutions like merging

Unity Batching

- Dynamic Batching
 - Same mesh with same material under 300 verts
 - Some overhead, but pretty good for small duplicated objects
- Static Batching
 - Higher poly models, but uses more memory

Unreal Batching

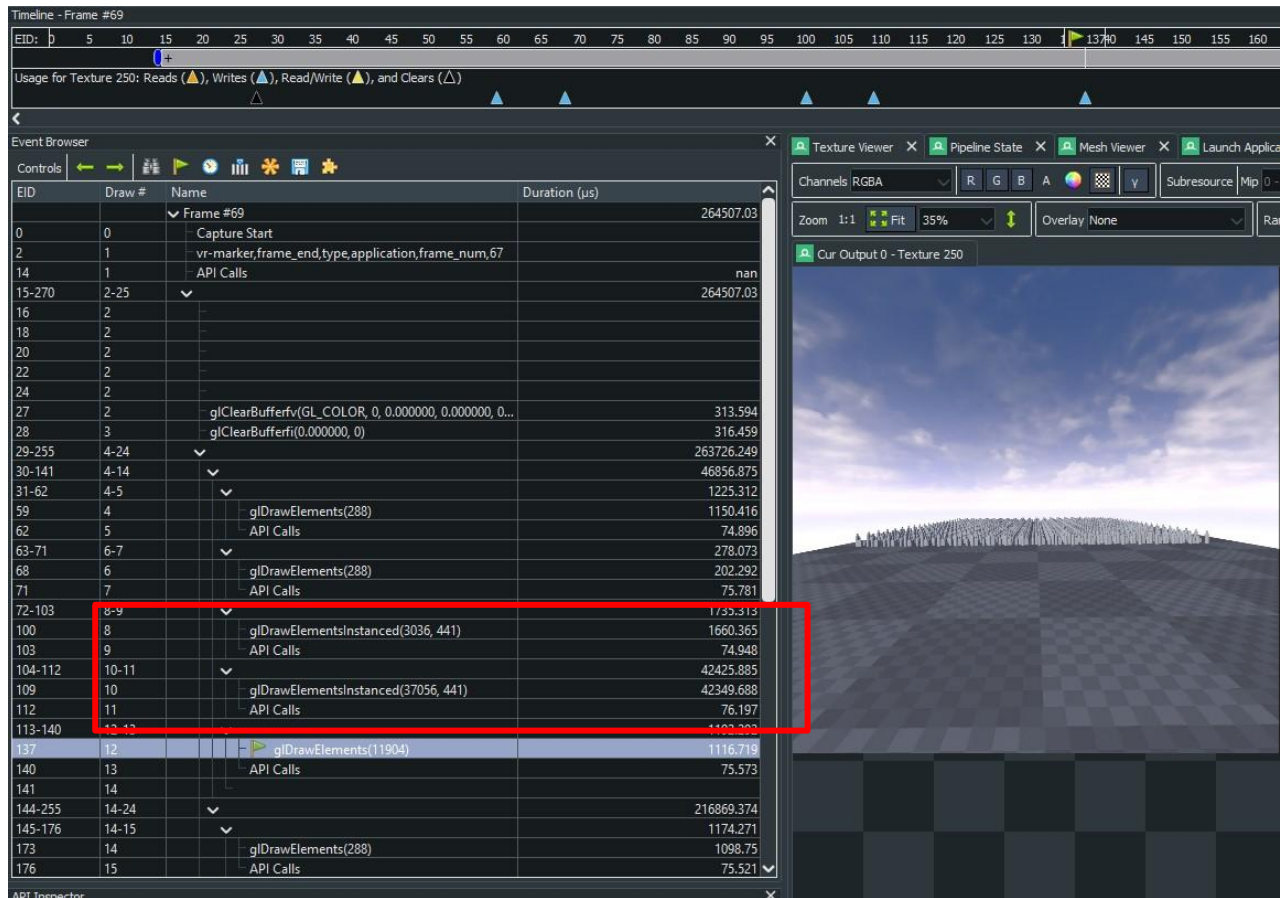

- Instanced Static Meshes
 - One draw call, but not much performance saving otherwise

Unreal - HISM

FPS: 5

Draw Calls:
5

Unreal Batching

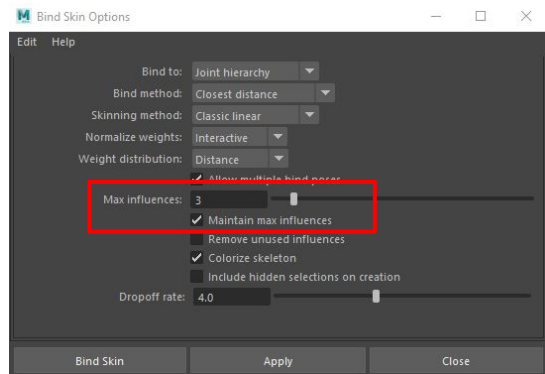

- Instanced Static Meshes
 - One draw call, but not much performance saving otherwise
- Hierarchical Instanced Static Meshes
 - LODs and culling works!
 - Hard to work with, so make a tool to help you

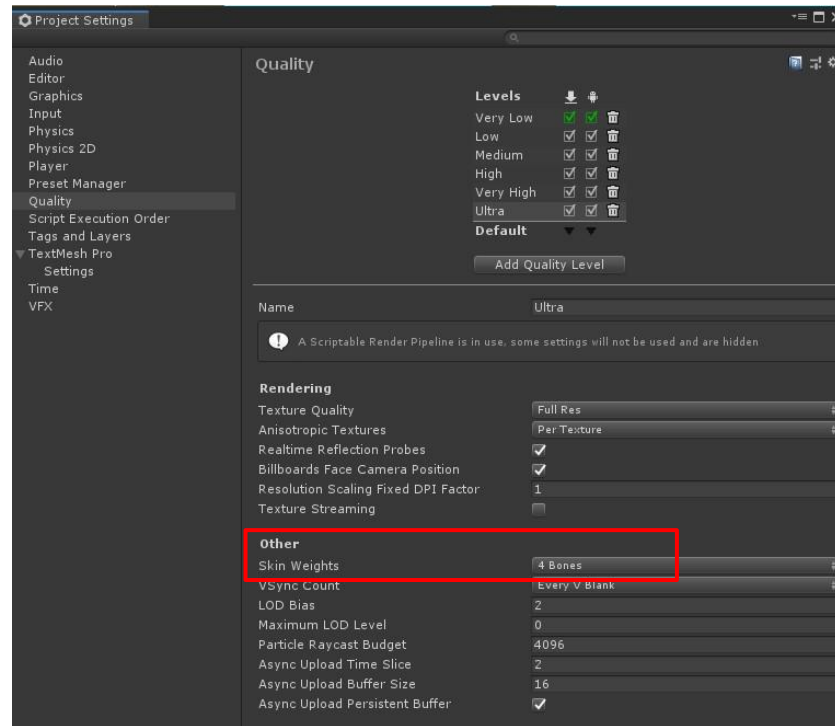

Skinned Meshes

Skinned Meshes

Maya

Unity

Skinned Meshes

Transparency

Transparency

Several objects are drawn after this wall, but are completely occluded by it.

Transparency

- Small objects with transparency perform pretty well
- Large transparent objects which overlap are the worst for performance
- Keep use of transparency small and infrequent
- Test on the device!!

Transparency

Soft alpha card effects have their own issues anyway.

Vertex Fog is an old method which still works.

on-screen

Get creative with transitions! Not everything
needs to be a fade

Post Processing

Post Processing

- Color correction can be done in shader
- If you really need bloom in a few places you can use some cards to fake it
- Probably can't use depth of field, screen overlays and fancy post shaders
- Think about what you would need from post-processing and try to implement in other ways

Test Test Test

Tests

Tests

FPS: 72

Well, yeah! Almost nothing else is going on in this scene!

Budget Your Art & Stay Sane

Summary

Thanks!
