02 BroadLeaf

03 Comparison

04 Conclusion

PART I:

Introduction

Problem Definition &
Existing Methods

Introduction

- **The problem to solve.**
 - Rendering large-scale high-quality trees in real-time, preferably interactable.
- **Why is the problem difficult?**
 - Complex geometry and texture
 - Data storage burden
 - Data streaming burden

Existing Solutions

Limitation of the state-of-the-art solutions (LOD based):

- Manual generated LOD, but not automatic.
- LOD transition is not smooth or fast.
- Not suitable for complex and large-scale forest scenes.

Existing Solutions (1)

Over-simplification issue for thin surfaces like grass and leaves.

~600 million triangle faces

Existing Solutions (2)

Nanite Foliage performance on our demo scene:

▼ Scene	27.73
▼ Nanite VisBuffer	11.06
▶ Nanite::CullRasterize	10.76
▶ Nanite::EmitDepthTargets	0.24
▶ Nanite::InitContext	0.04
▶ Lights	4.98
▼ ShadowDepths	3.49
▼ RenderVirtualShadowMaps(Nanite)	2.37
▶ Nanite::CullRasterize	2.30
BuildHZBPerPage	0.01
SelectPagesForHZB	0.01
ClearIndirectDispatchArgs	0.01
BuildHZBPerPageTop	0.00

Our Goal

Expected solution:

- Scene: Large-scale; real-time; cinematic quality (minimum quality loss when improving the efficiency); interactable.
- LOD for tree leaves: Automatic, smooth, and fast.
- Our application environment: Cloud gaming with powerful GPUs.

PART II:

BroadLeaf

Algorithm & Technical
Details

Algorithm Overview

BroadLeaf algorithm pipeline:

Data Compression (1)

A high-quality tree model:
~20 million faces, 500 MB

Data Compression (2)

Base leaf data:

- Geometry: Vertices, faces, and UV coordinates.
- Transformation: translation, uniform scaling, and rotation.
- Texture maps.

Data Compression (3)

- Trees without reference information:
 - Usually from modeling tools, e.g. SpeedTree.
- Trees without reference info:
 - Pre-categorize by materials.
 - Categorize by UV coordinates.
 - Calculate transformations.
 - Choose several arbitrary curling effects for each category.

Data Compression (3)

- Leaf internal deformation:
 - Fold: Folds both sides of the leaf along the Y-axis.
 - Curl: Curls the leaf around the X-axis
 - Twist: Twists the leaf around the Y-axis.

Data Compression (4)

- Compressed geometry data size:
 - $\text{leaf_instance_size} (\sim 200\text{KB}) * \text{num_of_base_leaves} (32) = \sim 6.4\text{MB}$
- Around 2 order of magnitude: 500MB $\rightarrow$ 6MB

Automatic LOD (1): Quad-leaf

Automatic LOD (1): Quad-leaf

PCA: Compute the 3 principal axes.

Automatic LOD (1): Quad-leaf

Automatic LOD (2): Quad-leaf

Input
#F: 6,004,752

LOD 0
#F: 307,936

LOD 1
#F: 15,408

LOD 2
#F: 762

Automatic LOD (3): LOD Tree

Texture Baking (1)

Mesh of N quad-leaves
#Face = $2N$

$$\text{\#UV grids } M = (\lfloor \sqrt{N} \rfloor + 1)^2$$

UV mapping

Texture Baking (2)

Mesh of N quad-leaves
#Face = $2N$

Albedo map of the mesh on the left

LOD Transition (1)

Requirements:

- Visually seamless transition
- Computational fast

A quad-leaf is represented as:

c: Center (float3)

T: Tangent vector (half3)

B: Binormal vector (half3)

c': UV coordinate (float2)

t: UV tangent length (half)

b: UV binormal length (half)

LOD Transition (2)

LOD Transition (3)

LOD Transition (4)

Runtime data structure for GPU driven:

```
Struct treerootnode{
    uint treenodetype;
    float3 center;
    float radius;
};
```

```
Struct QuadLeafNode{
    float3 centerpos;
    half3 tangent;
    half3 binormal;
    float2 uv;
    half2 uvextent;
    uint leafid;
    uint childnodestartindex;
    uint childnodecount;
};
```

LOD Transition (5)

Fill the buffer from GPU Scene.
(Apply culling here.)

Dispatch the mesh shader according to the Quadleafnode Buffer count.

In mesh shader, we compute the screen size of quad-leaves.

Why use mesh shader?

- We can traverse the details of the tree and draw the proper size of quad-leaves.
- If using computer shader, we have to write and read the quad-leaves that need to render to a buffer for rendering, which needs more GPU access bandwidth.

LOD Transition Result

■ LOD 0
■ LOD 1
■ LOD 2

Pipeline Design Summary

- Compress the data based on the feature of tree leaves.
- Design leaf-level granularity LODs and organize them hieratically.
- Use GPU driven rendering pipeline (mesh shader)
 - Reduce I/O cost between CPU and GPU.
 - Avoid writing a buffer before rendering.

Culling (1)

- Frustum culling and occlusion culling
 - Level by level according to the LOD tree.
 - Granularity: quad-leaf
 - Can handle layer-on-layer leaves.

Culling (2)

- Hard to apply occlusion culling on foliage structure:
 1. Depth pre-pass with alpha test doubles the timing.
 2. Structures like foliage are hard to be well-occluded.
- Our method enables the access to the fine granularity, which increase the culling effectiveness.

Occlusion Culling Result (1)

Without Occlusion Culling:

- Total Primitives: 1,706,885
- Total Pixels: 194,683,133

With Occlusion Culling:

- Total Primitives: 407,330
- Total Pixels: 52,502,771

Occlusion Culling Result (2)

Without Occlusion Culling

- Total Primitives: 1,161,713
- Total Pixels: 111,764,219

With Occlusion Culling:

- Total Primitives: 650,575
- Total Pixels: 62,296,780

Subdivision

- Subdivision for coarse input models.
- Subdivide the LOD level-0 quad-leaves.
- Curling after subdivision.

Foliage Interaction

Preprocess

Tree Simulation

Update the tree
BVH for Collision

Generate rays from every mesh point; Use vertex normal as the ray direction.

Foliage Interaction Result

PART III:

Comparison

Comparison with Nanite
Foliage

Comparison (1): Efficiency

▼ Scene	65.44
▼ Nanite VisBuffer	44.70
▶ Nanite::CullRasterize	44.40
▶ Nanite::EmitDepthTargets	0.24
▶ Nanite::InitContext	0.05

Nanite foliage: ~44ms

Ours: 3~4ms

Comparison (2): Efficiency

▼ Scene	60.81
▼ Nanite VisBuffer	37.35
▶ Nanite::CullRasterize	37.02
▶ Nanite::EmitDepthTargets	0.26
▶ Nanite::InitContext	0.05

Nanite foliage: ~37ms

Ours: 3~4ms

Comparison (3): Efficiency

▼ Scene	31.96
▼ Nanite VisBuffer	15.42
▶ Nanite::CullRasterize	15.22
▶ Nanite::EmitDepthTargets	0.14
▶ Nanite::InitContext	0.04

Nanite foliage: ~15ms

Ours: 3~4ms

Comparison (2): Faithfulness

BroadLeaf

PART IV: Conclusion

Final Demo

Limitation & Future
Work

START ENGINE

腾讯原生云游戏技术方案

Application

- Video gaming
- Virtual reality and augmented reality
- Geographic environment visualization
- Filmmaking (e.g. virtual production)

Limitation & Future Work (1)

- Better LOD mesh generation especially for the higher levels (low-poly meshes)
 - Smoother transition with even fewer elements.

Limitation & Future Work (2)

- BroadLeaf handles well the plants with leaf reference structure.
 - Non-leaf-reference structure: grass, banana tree, ...
- Ray tracing-based method:
 - No need to generate LODs.
 - Shadow: more efficient and more stable.
 - The cost increases slower when the complexity of the scene increases.
