

# Killer Portfolio or Portfolio Killer

Greg Foertsch – Firaxis Games

Jeremy Bennett – Valve

Justin Thavirat – Blizzard Entertainment, Inc.

Shawn Robertson – Irrational Games

Wyeth Johnson – Epic Games

Alison Kelly - Moderator

## Portfolio Don'ts

- Don't complicate or slow down the portfolio website with complicated layouts, sluggish flash menus, annoying music, excessively large images, etc. Get to the art quickly. The person reviewing your portfolio website is short on time.
- Don't password protect the entire website. Just use passwords to protect the confidential imagery.
- Don't use any file compression or unusual video codecs. Keep it simple.
- Don't be unfocused. There is no need to see figure drawings when you are applying for a level builder position.
- Don't include concepts if the model and textures don't match.
- Don't present a cumbersome traditional portfolio, but if you're sending one in make sure it's not too physically large (20 images max @ 11x17). It should be in a portfolio book and should not have loose images floating around. Also, do not include original art as it will not get sent back.
- Don't use poor quality photos of your work. Try to use a scanner.
- Don't make me work to get to your portfolio. An Art Director will want to see your art work, not how well you know HTML 5 or how many star wipes you can use in After Effects.
- Don't send a DVD, if possible. Physical things get lost easily. It's much easier to send around a web link than it is to pass around physical media.
- Don't email a 50MB zip file. It most likely won't get past the mail filters. Websites are best.
- Don't list that you are an expert in every software package available. Your proficiency may be questioned in an interview, so only list it if you really know it.

## Portfolio Do's

- Do make the portfolio website extremely easy to use and easy to navigate. It should load images fast (skip the flash) and require as few clicks as possible to get around (no deep menu nesting).
- Make sure the portfolio website works on different browsers (IE, Firefox, Chrome, Safari).
- Do include your best work at the front with a strong focus on art samples that demonstrate your capability in the position you're applying for in the art style applicable to the company you're applying to. (i.e. character modeling, environment concept, etc.)
- Do edit your portfolio and include only your best work. Less is more. 10-15 strong images are plenty. Too many duds included in an otherwise strong portfolio will bring into question your ability to judge your cream from your crop.
- Do keep your portfolio website simple with just a "professional art, personal art, resume, and contact" menu.
- Do be sure to put your name and contact info on every page and image.
- Do list what you did on each image even if you did it all (concept, modeling, texturing, lighting, etc.)
- Do edit your portfolio. Five great images are better than ten images made up of five great images and five poor images. More is not always better and being able to edit your portfolio is important, so remove any content that is inconsistent in quality.
- Do pay attention to presentation. Good presentation can make a mediocre asset look fantastic. I'm not asking you to try to fool me by hiding modeling mistakes in a carefully lit render, but seeing how you choose to present an asset is important.
- Do consider creating just one scrollable page with your best portfolio pieces on it.
- Do choose appropriate music for your website or demo reel. Overpowering audio can either enhance or detract from the viewer's experience.
- Do treat your credits professionally. Thanking friends and family isn't really appropriate.

## **Portfolio Specifications:**

Concept Artist  
Environment Modeler  
Character Modeler  
Level Builder  
Animator  
FX Artist  
User Interface Artist  
Tech Artist

### **Concept Artist**

- This portfolio often has a mixture of figure drawing, character concepts and environment paintings. It is extremely important that portfolio display an understanding of a difference between pretty pictures and useful concepts. Mood paintings (i.e. Mullins) are great for lighting reference and marketing purposes but can be difficult to model from. It is often difficult for young concept artists that are influenced by this type of concept to understand the difference between loose painting and simply being sloppy. Be sure to include images that have call outs and clear descriptions that can be handed to a modeler, especially with mechanical concepts.
- Awe-inspiring creative ideation (your epic, mind-blowing, never before seen ideas) and technical execution should exist in the portfolio (your ability to sketch and illustrate so you can communicate your amazing ideas quickly and clearly).
- The portfolio should be job related. 80-90% professional subject matter (sci-fi, fantasy, etc.) and 10-20% personal/fine art (and only if you feel your figure drawings and plein air paintings are awesome).
- If possible, show a stylistic range but focus on the style you're best at (hopefully it's applicable to the studio you're applying for).
- Sketchbooks and thumbnails that demonstrate your thought process and the evolution of your ideas are great to see.

### **Environment Modeler**

- The ability to put character into environment objects is important. Show that you can make a trashcan with character and you'll get someone's attention.
- With every aspect of environments look to imbue them with "maximum character." Unless you can make a crate epic and interesting there's no sense in trying to make a statue, building, shrine, etc.
- Process images (Hi-res and Low-res) are very helpful because they demonstrate process and technique. UV layouts are huge, so it helps to see texture sheets for objects.
- Include some environment renders that show a good understanding of how all the objects in environment harmonize together through color, value and lighting. It is also helpful if the scene references a concept image, so it is clear that they can translate 2D to 3D.
- Provide scenes like a corner of a room that contains a few objects. This shows your models are cohesive and you understand the context in which the model is being used.
- Possibly include images that display the ability to work off concept and adapt. There situations when concepts may not be ready; so find a photo of a grainy and out of focus image and make a portfolio piece from it.
- Show your work in a few different ways (i.e. as a lit money shot, ortho view, and untextured model to show off the modeling)

## **Character Modeler**

- Figure drawing is important to be able to show a clear understanding of weight, gesture and proportion, but knowing how to express anatomy in 3D is also essential.
- Process images (Hi-res and Low-res) are very helpful because they demonstrate process, technique, and topology that will deform correctly.
- Show the side view of a character model. It is almost always neglected in lieu of the front or back view, but this immediately shows if the applicant understands weight and form.
- UV layouts and texture sheets are important to see here as well. These texture sheets should show painting skill as well as a good understanding of color theory.
- It is also helpful to see the concept image for the character, so it is clear that they can translate 2D to 3D.
- Demonstrate awe-inspiring creativity with the character work and a solid understanding of anatomy, construction, gesture, etc.
- Show something unique that hasn't seen in a game before. Display not only technical chops, but a unique vision.
- Many studios look for character modelers with strong traditional character art and illustration backgrounds and a strong understanding of contemporary modeling/sculpting pipelines.
- Show a range of work that includes stylized work, realistic work, humanoids, creatures, robots, monsters, aliens, etc.
- Show how you translate a concept to a sculpt, show your clean low poly models, texture pages, efficient UV layouts, final mapped asset, show it posed and lit and how you imagine the asset looking in the environment. Be detail oriented.

## **Level Builder**

- The level builder is a bridge between design and art. Most of the level builder's time is spent in the game engine, but they will also have the chops to crank out some models when the need arises. Show game engine knowledge, any game engine is fine.
- Tell a story within the space.
- Display and understanding of how to make a building feel like a real space and not like a bunch of random shapes that have been dumped down to create a paintball field.
- Display an understanding of tactical space. How do you make a player move around your space in an interesting fashion?
- Look up! Use that 3<sup>rd</sup> dimension everyone is going on about all the time.

## **Animator**

- This position requires a strong sense of character, timing, and weight, along with the technical savvy it takes to get your animation working in a real time environment.
- For a junior position, previous experience isn't so important, but your reel really needs to stand out. Animation Mentor reels provides a good base-line of the competition.
- Run cycles, attacks and idle animations are good to show, but there is a lot of narrative in games, and the ability to work with VO or craft interesting interactions between characters is important.
- 11 second club reels are great because they show your ability to make dialogue interesting.
- Don't worry about good looking models. Lots of free rigs are being used in reels.
- Show strong gameplay animation samples within frame count requirements (creative runs and walk cycles, deaths, attacks, transitions, fidgets, etc.)
- Show strong and expressive character acting that includes dialogue and lip syncing work.

### **FX Artist**

- FX artists need a strong understanding of modern game engines and how to efficiently achieve a wide range of FX efficiently.
- Show a lot of range...realistic fire, smoke, and sparks along with creative stylized magical FX, epic explosions, and really over the top never before seen stuff with an eye towards keeping it in budget.
- FX artists are like musicians with an amazing eye towards the visual tempo, rhythm, and timing, of their FX animations. Make sure even your simple campfire FX shows this.

### **User Interface Artist**

- Most UI candidates display a graphic design background with experience in traditional illustration, typography, user experience, and web design.

### **Tech Artist**

- Tech artists are broken into a few different categories, and can fall under the art or engineering departments, depending on the studio. They include things like:
  - Rigging
  - Maya tools (python)
  - Max Script
  - Custom tools (C++)
  - Web development tools
