Out of Sight, Out of Mind: Improving Visualization of AI Info

Mika Vehkala Principal Game Tech Programmer @ Guerrilla Games

Contents

- Introduction
- Part I Visualizing Runtime Flow
- Part II Record and Playback Data
- Part III Visualizing Algorithms
- Behind the scenes

Introduction

- Improving visualization of your data helps in
 - Debugging
 - Verification
 - Understanding
- Challenge your workflows and tools

Simple example

Nice properties for a debug tool

- Minimize impact on client
 - Low memory requirement
 - Low processing power requirement
 - Lean API for minimal debug code

=> Separate process, communicates over network

- Clutter-free UI
 - Shouldn't need user's manual for the tool
 - Helps to keep visualization simple as well

Part I – Visualizing Runtime Flow

- What are the main components
- Who manages the lifetime
- What is the lifetime
- What are the dependencies

Sequencer

- Hierarchy to show structure
- Timeline and tracks to show history

Hierarchical Timeline View

Part II – Record and Playback Data

- Simple and data agnostic
- Register binary feed and callback
- Add arbitrary data { ID | Time | Byte[*] }
- Scrub timeline to send back to feed

Use in Killzone Shadowfall

- MP Bot AI debugging and validation
- Gameplay animation debugging
 - Player
 - NPCs
- Took ~1 week to integrate and hook-up debug calls

Part III - Visualizing Algorithms

- How to visualize algorithms
 - Not just the end result but step-by-step
- No access to renderer
 - Long turn-around time to use in-game rendering
- Also, alternative viewport

I've found out that...

- Visualizing data is not trivial
 - Iterate but keep it simple
- Time is of the essence
 - Collapse into single image
 - Series of snapshots

Behind the scenes

- ReView communicates using RPC over TCP/IP
 - Major contributor to extensibility!
- C# for building the tool

Quick look at the code

Feed.Connect("localhost", 5000);

track_id = Feed.AddTrack(parent_id, "Name"); item_id = Feed.AddItem(track_id, time, "Name"); Feed.AddLog(item_id, time, flags, "Log entry");

box_id = Feed.AddBox(time, Inf, Matrix.Identity, center, size, Color.Green);
Feed.RemovePrimitive(box_id, later_time);

id = Feed.AddMesh(time, Inf, Matrix.Identity, center, flatShaded : true);
Feed.AddTriangle(id, time, pointA, pointB, pointC, Color.GreenAlpha);

Takeaway

Don't guess what happened... ...know what happened!

That's All!

Introduction

DLVE

- Our version of a cheap, but powerful tool for historical debugging
- Tools are always worth the time, but it's never too late
- Can be built at very low cost
- I should've done it sooner

Background on Evolve and TRS

E

VE

- Online cooperative/competitive first/third-person shooter
- Always plenty of AI, even in full online games
- AI agents also must play all roles in liu of human players
- Rapid development; need to leverage lots of playtest data

Bare Bones Requirements

E

- Get it up and running in a man-week
 - Took almost as long to prepare this presentation $\ensuremath{\textcircled{\sc o}}$
- Rapidly and safely add data; vis comes second
- A dedicated server recording should feel like a local session
- Runs on server, so minimum CPU overhead during recording

Stupid-Simple Data Stream

E

VE

- Self-contained events and metadata in a contiguous memory stream
- Metadata typically very small, and easily quantized
- Store frame markers to establish timeline
- If the stream is nearly full, we purge old contents
 - "Version 2.0" would handle this more intelligently
- The data's all there reconstruct and render later on a visual client

Writing the Stream

New Render Frame

E

E

Interpreting the Stream

- We always know what happened in the past, relative to **T**
- Turn small atomic events into useful data
- Higher granularity than this example (details later)

Versioning

VE

E

- We simply distinguish between last-readable version - pretty standard (m flightType);
- Each event type's serialization multiple versions

SERIALIZE()

VEC3 RANGE(m pointStart,4000.f); VEC3 RANGE(m pointEnd,4000.f);

if (version >= 3) SION and a

• Periodically strip old version support, just so the code is tiny

Game Data Compatibility

VDLVE

- We always know the originating build's stamp; sync to data as necessary to reference large data
- When possible, events store *inputs*, and re-execute during timeline scrubbing
 - Determinism is important, but only needed in a small subset of systems
- Some events just serialize results if they're tiny

Minimizing Metadata

Referencing Static Data

E

E

- Minimal, just relates directly to static BT data
- Sync to older game data as necessary

Re-Query With Stored Input

- For a tactical query, we need to see all candidates and their scores (tons!)
- Way too much to store, so we store the context used to conduct the query
- Just re-execute tactical query; metadata as input

Playback & Scrubbing

E

- Timeline shows a range of time with color-coded markers
- Linearly process entire stream up to the displayed frame
- Use gamepad to scrub back and forth, detach camera, select different agents
- Aggregating larger context under the hood for a complete picture
- Anything traditional debug displays can show... but with history

Version 2.0

E

- Obvious next step is to visualize in external app
 - Though, something to be said about being in-game
- Stream over the network, "infinite" history
- Or write events to a DB, such as a free NoSQL key/value store
 - Visualize on the web or anywhere else
- Better visualization, animation/position rewind
 - In the works, bit-by-bit as necessary

Conclusions

E

- So much data: from any bug report, we have recent history for **all** active agents
- We see everything^{*} that's happened on a remote dedicated server

- Engineers new to the team were able to jump in and track down tricky bugs in a fraction of the time... says Troy
- We observed and fixed bugs we weren't even looking for
- Replaced all the disjointed visualization junk we had before
- * almost

Conclusions

If you have a need for historical debugging and have no resources to spare, try something like this.

You won't regret it.
